

Phytron Stepper Motors – Precision for challenging applications

Precision and innovation for challenging applications

Stepper motor technology is particularly suitable for precision applications under extreme environmental conditions. Whether vacuum, cryo environment, high temperature or under the influence of radioactivity - the Phytron motor series are tough and do precision work, because stepper motors can position very accurately without a fragile feedback encoder.

Our control units perform, especially in applications that rely on very precise and smooth running behaviour. We control motors in electron microscopes, accelerator experiments or also in paper production machines - with up to 1/512 step (102 400 positions per revolution with a 200 step motor). From the power amplifier to the modular, cost-effective multi-axis system we offer the right control concept for your requirements. You remain flexible with Phytron, because we supplement the interest in and the ability of our customised products by developing them further. Customers from different industry sectors rely on our decades of experience in highly demanding application fields.

Why buying a Phytron product is always a good decision:

We are a customer-oriented high-technology company certified to ISO 9001 and EN 9100. We have the process know-how of more than 1000 stepper motors in space operations for the successful development of your demanding application.

We offer best service – we also ask the right questions at the right time. Our Competence Center quarantees targeted consultation and therefore the early identification of requirements and any potential problems.

Based on our proven products used in the series, we develop solutions that provide precision work for our customers with extreme reliability. Whether for extreme environmental conditions or as a perfect fit for your particular application - Phytron motors are always a good choice!

Phytron combines the flexibility and client-specific consulting from a niche player with the efficiency and standardised quality assurance processes of series production. As a quality conscious business we produce in Gröbenzell near Munich.

INDUSTRIAL Environments

Precise. Reliable. Dynamic.

Phytron's STANDARD industrial motors are eminently suitable for applications in engineering and industry. Whether it's for the positioning of slides, the adjustment of pressure rollers or sensitive optics, the synchronised delivery and application of labels or for handling in mail sorting - fast and reliable running performances are constantly demanded. Precision, high torque and solid craftsmanship make our standard industrial motors an excellent choice for environments up to IP 50.

The phyBASIC series has good speed-torque performance, high low-end torque and a solid build, while the ZSS series prides itself with balanced rotors, smooth rotation, extremely low acoustic noise and low resonance with the highest positioning accuracy. Also, the ZSS operates to an extended operating temperature of -30 to +120 °C.

ZSS

Precision stepper motor with smooth running, IP 40, ∅ 19 to 56 mm

phyBASIC

High precision and smooth running

DMP

Inertial damper for stepper motors DMP 29/37

HARSH Environments

Robust. Powerful. Dependable.

Phytron's HARSH Environment motors are particularly suited across a broad range of heavy-duty manufacturing industries. With precise running performance, high torque and its robust design to a submersible IP 68, the most challenging conditions are solved with our HARSH motors. In climate chambers, setting paper thickness in high humidity, the adjustment of rotor blades in aerospace or inside fuel tanks, these motors perform the most arduous of tasks accurately and reliably.

ZSH

Up to IP 68 stepper motors, Ø 57 to 107 mm

EXTREME Environments

Vacuum. Cryo. Radiation.

The Phytron EXTREME stepper motors and actuators have evolved and perfected through the use of materials and manufacturing processes optimal for unusual environmental conditions in industry or science. Vacuums up to 10^{-11} mbar, cryogenic environments down to -269 °C, high temperatures up to +200 °C, radiations of up to 10^6 J / kg or extreme vibration loads - with minimal particulate emissions. These motors adjust optical elements in satellites, process samples in molecular analysis devices, turn filter wheels in sputtering and transport samples in liquid nitrogen.

VSS / VSH

Vacuum stepper motors Ø 19 to 125 mm optional Cryo stepper motors

ΙΔ

Linear actuator for applications in vacuum and cryogenic environment \varnothing 25 mm

SPACE

Precise, Clean, Resistant,

With more than 25 years of heritage and more than 1000 motors for a wide range of space projects [CASSINI-HUYGENES, EPIC ROSETTA, STEREO, KOMPSAT, CURIOSITY, JUNO, MAVEN, ENMAP,] we are looking forward to solving your challenging application! Our *phySPACE* withstands vibration and high shock loads, resits vacuum up to 10-11 hPa, radiation up to 10⁶ J/kg, cryogenic environment down to -269 °C or high temperature up to 200 °C while achieving minimal outgassing.

phySPACE

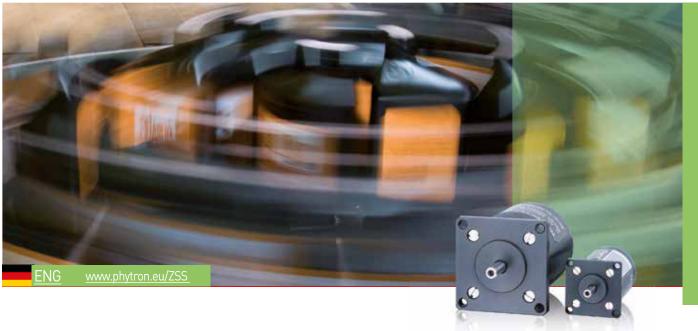

Stepper motors for space Ø 20 to 57 mm

CUSTOMISING

Standard + Efficient Customising = cost optimised for a perfect fit

Whether it's a tailored outer housing, ceramic bearings, high vibration and shock loads or rad-hard designs, the most unusual applications are solved based on a motor series with effective customisation by getting it right first time. We will assist you to combine standard components into a turnkey design that fits the bill.

INDUSTRIAL

ZSS Stepper Motors

For Applications with Extended Temperature Range

The proven 2-phase hybrid stepper motors series ZSS combine highest precision with smooth running characteristics. With up to 102.400 approachable positions (200-step motor, driven in micro stepping mode with 1/512 step resolution and encoder) the ZSS motor provides your application with highest precision positioning capabilities.

The ZSS serie differs from standard market motors by the extended ambient temperature range from -30 to +80 °C.

Thus, the motor is suitable for the most demanding applications in diverse areas of application.

Perfect-fit for your application:

- · with gear
 - GPL low-backlash planetary gears
 - PLG planetary gears
 - HD Harmonic Drive gears
 - GSR worm gears
- · with motor brake
 - permanent magnet brake for 24 V_{DC} supply voltage
- with encoder
 - standard resolution 500 lines
 - 3-channel optical incremental encoder

In Focus

- 2-phase hybrid stepper motors200-step (step angle 1.8°)
- 200-step (step aligte i
- Connection options:
 - 4-lead parallel
 - 4-lead in series
 - 5-, 6- or 8-lead connection
- Holding torques from 3.8 to 700 mNm
- Protection class IP 40 for ZSS with free wire ends
- Perm. ambient temperature -30 to +80 °C (no frost)
- Max. operating voltage of the power stage (Intermediate circuit voltage: 70 V_{pc})
- Insulation class F acc. to VDE 0530
- Test voltage
 ZSS 19 to 52: 700 V (1 min)
 ZSS 56 to 57: 1500 V (1 min)
- Optional:
 - 2nd shaft (IP 40)
 - encoder
 - gear
 - motor brake
- · Customised shaft design
- Special windings

Highlights

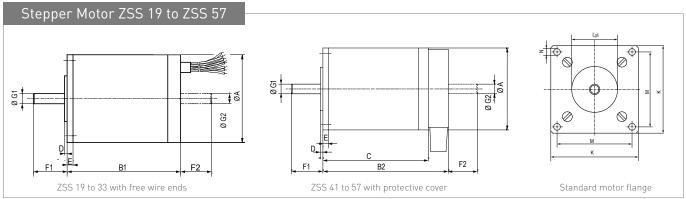

Extended temperature range

The ZSS stepper motor not only convinces with a very balanced, smooth and low resonance running performance with maximum positioning accuracy, but also with the extended ambient temperature range of -30 to +80 $^{\circ}$ C.

Variety of expansion stages

With a variety of options and the high level of vertical integration of Phytron, the ZSS is the ideal basis for customised applications. Gears, brakes, encoders, shaft or flange adjustments or special windings - the ZSS offers the optimum basis for efficient customising.

⁶⁾ max. operating voltage of the power stage (intermediate circuit voltage) All values given above refer to room temperature.

Electrical Connection / Connection Types / Phase Current

The Phytron stepper motors type ZSS are built in 8-lead windings (standard).

8-lead with free wire ends

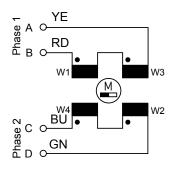

Alternative windings such as 4-lead are available on request:

The motors can be used with unipolar or bipolar control mode, as the windings can be differently connected.

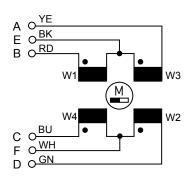

5- lead or 6-lead connection are applicable for the unipolar control mode.

In the bipolar control mode, 4-lead motor wiring is required, windings connected in parallel or in series

The information in the ZSS motor connection leaflet (delivered with each motor) must be regarded when wiring the motor in order to provide for EMC compliant wiring. The motor connection leaflets are also available for download on the Phytron homepage.

4-lead / serial windings / bipolar mode

6-lead / unipolar mode

Phase currents

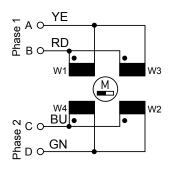

For ZSS Phytron stepper motors, the rated current [A] per motor phase is printed on the rating plate. The last digits of the motor's type number define the rated current.

Example: ZSS 32.200.1,2

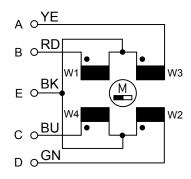

The rated current is defined for full step operation, at bipolar control mode, with parallel connected motor windings.

According to the connection mode, the motor windings receive different currents. Therefore, for identical power dissipation in the motor, the allowable phase current is determined by the connection mode.

For short time, double current overload is acceptable.

4-lead / parallel windings / bipolar mode

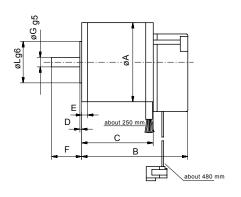

5-lead / unipolar mode

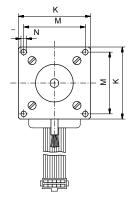

Control mode	Bipolar control mode Full step operation		Unipolar control mode Full step operation	
Motor connection	4-lead parallel windings	4-lead serial windings	5-lead	6-lead
Allowable phase current for identical power dissipation	Rated current	Rated current x 0.5	Rated current x 0.707	Rated current x 0.707

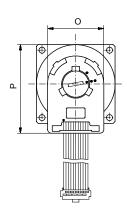

Option: Stepper Motor with Encoder

The stepper motors ZSS 25 to ZSS 57 with mounted encoder are particularly suitable for use in control actuators or for system monitoring.

- Motor connection by free wire ends
- Encoder connection with flat cable with 10-pin connector
- Protection class IP20

Option: Stepper Motor with Heat Sink

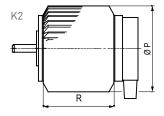

The ZSS stepper motors are also available with a mounted heat sink. Depending on the motor's mounting position, a heat sink with radial fins (K1) or axial fins (K2) can be selected.

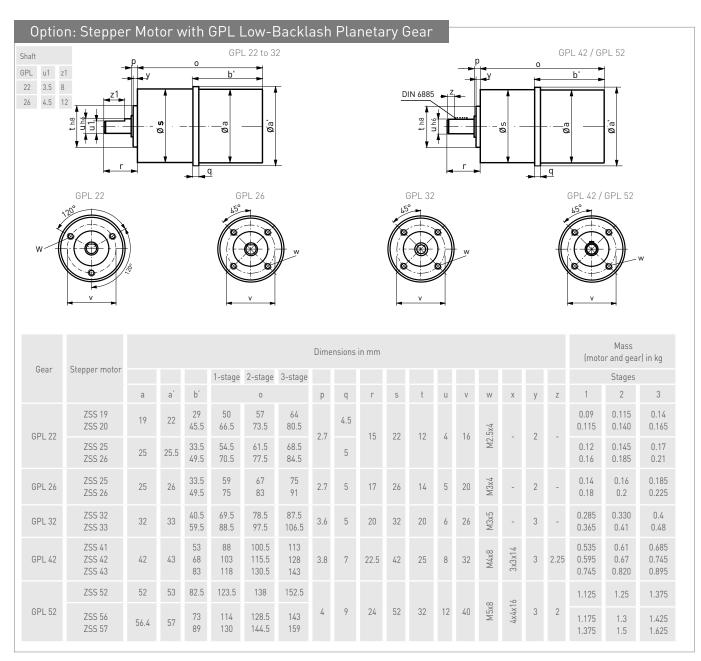

The use of a K1 heat sink increases the stepper motor's thermal dissipation surface by a factor of approx. 3.9. With a K2 heat sink, it is increased by a factor of approx. 3.4.

A heat sink can be mounted subsequently, preferable by Phytron.

Stepper Motor with GPL Gear • Stepper motor mounted gear

- 1- to 3-stage planetary gear
- Low gear backlash
 - Standard: 20 to 50 arcmin
 - Low-backlash: 6 to 15 arcmin
- Maximum permanent torque 0.1 to 38 Nm
- 100% permissible short-term overload
- Adapted for permanent, alternate or intermittent operation
- Ideal for combinations with toothed belt modules
- 4:1 to 256:1 reduction ratios (depending on the gear type)
- High efficiency
- Low gear inertia
- Perm. temperature range -30 to +90°C
- Maintenance-free permanent lubrication

Gear Material

- Gear housing
 - GPL16 and 22: stainless steel
 - GPL 26 to 52: rustproof for normal environmental conditions
- Output shaft: 2 deep groove ball bearings

Gear Operating Modes

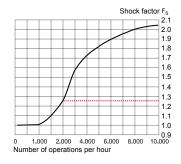

1: Continous operation

The gear box's operating time exceeds 15 minutes without a break or the duty cycle is more than 60%. In no case the gear box housing temperature may exceed 70 °C.

S5: Cyclical operation

The gear box's duty cycle is less than 60%. The number of operations per hour can range anywhere from a few to several thousand. If the number of operations exceeds 1000 per hour, the maximum torque occuring has to be multiplied by a shock factor to take into account the additional dynamic load. The data in this publication are based on software models and empirical values and on a shock factor of 1.25.

Shock Factor for Cyclical Operation (S5)

ZSS Stepper Motor with HD Gear

The Harmonic Drive® gears are based on a totally new operating principle. The transmission force is exerted by a resilient deformable toothed steel cylinder flexspline which transmits the motor rotation to the drive shaft. Drive shaft and output shaft direction is are opposed.

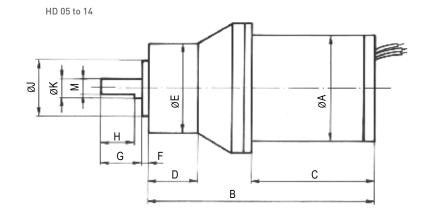

Backlash and torsional stiffness

Harmonic Drive® gears have particularly low backlash. In practice, the tooth-contour backlash can be neglected (see page 9). The total gear torsion is equal to the sum of ½ backlash + torque/resillient constant.

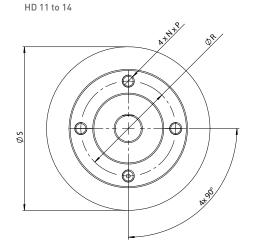

HD Gear

- with mounted stepper motor ZSS 25 to ZSS 52
- Reduction ratio depending on size 50:1, 80:1, 100:1
- High reduction ratio in a small volume
- Low weight
- Low mass inertia
- High permissible torque, in comparison to the size
- High drive speed
- Very low backlash in comparison to conventional gears: 0.4 to 4 arcmin
- High efficiency

HD 05 to 08

Note: Motor dimensions and technical data: see page 2.

¹⁾Mass inertia of the motor: see page 2.

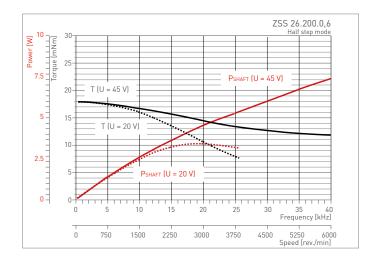

Frequency characteristics

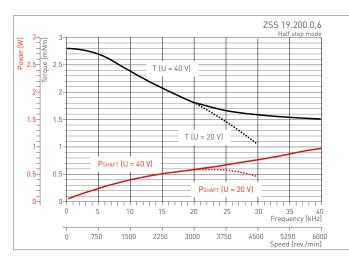

The curves correspond to the limit values of the operational characteristics (M) as a function of the control pulses (frequency/speed), for two different supply voltages (U).

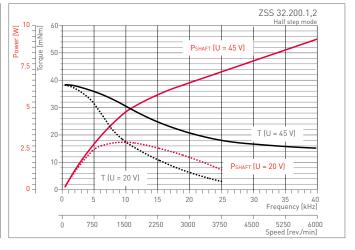

The motor connection type is 4-leads with parallel windings. The motors are controlled by Phytron stepper motor power stages in the half-step mode.

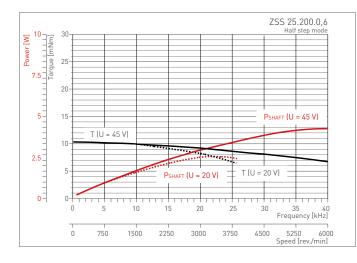

Power characteristics

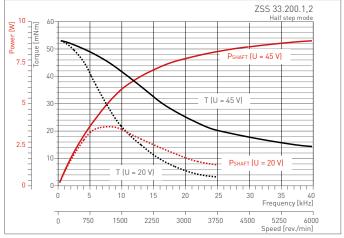

For each frequency curve, the power characteristic (P) indicates the power delivered by the output shaft.

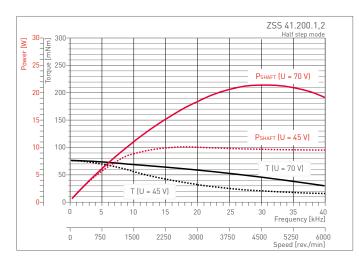

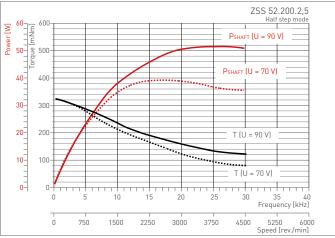

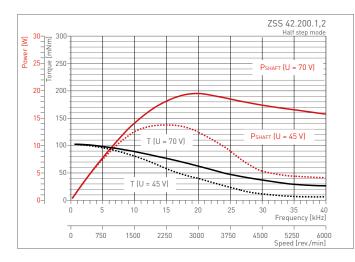

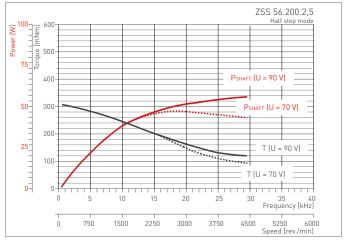

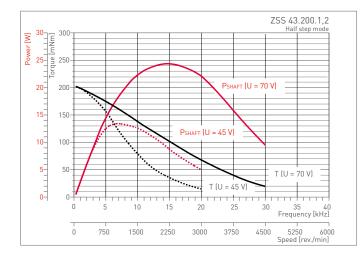

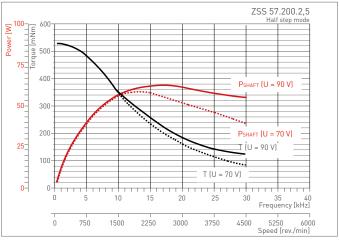

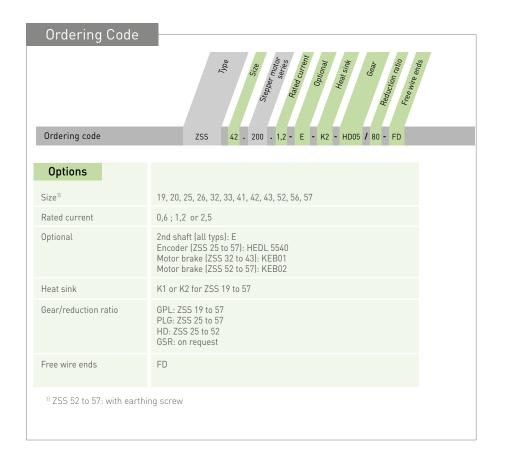

ZSS Stepper Motor INDUSTRIAL

CONFIGURATION AND OTHER DATA

You will find all relevant performance data, dimensions and key figures under the following QR code. In addition to our motors, we offer other components (gearboxes, feedback systems, linear units, etc.) as well as broad customization options (temperature, radiation,

radiation, vacuum, design, etc.). We will happily advise you!

A motor connection leaflet is enclosed to every delivery of stepper motors. PDF files are available for download on the Phytron homepage.

phyBASIC™

Precision Stepper Motor with High Torque and Smooth Running

Our motor series $phy BASIC^{TM}$ combines the advantages of a price-optimised design with excellent operating characteristics. That makes the $phy BASIC^{TM}$ motors particularly suitable for standard applications in the manufacturing industries. Good running performance, high torque and solid craftsmanship make the $phy BASIC^{TM}$ an excellent choice for environments up to IP 40 when it comes to quick precise positioning tasks. Through the 200-step design, the optimised metal sheet cut and the smooth running the motor is also suitable for high precision applications.

Combined with our modular motion controller *phy*MOTIONTM, the driver TM StepDrive [for SIMATIC® ET200® SP] or our amplifiers you will receive a perfectly tuned system of high quality motors, power amplifiers and controllers. Through a careful selection of suppliers and our certified quality system [ISO 9001), we make sure that *phy*BASICTM motors meet our high quality requirements and can be reliably used together with our electronics. You receive accustomed high Phytron quality at good prices - bundled with our excellent support.

More than just a standard

To help you find the perfect solution for your project, we offer you the opportunity to realise individual changes on the basis of our motor series. If $phyBASIC^{TM}$ or the VSS in vacuum series is not sufficiently adapted to your application, we will develop one of our motors to the "perfect fit" for your application.

With our vast application experience of drives e.g. in paper production or even satellite optics we have the know-how to move your application.

In Focus

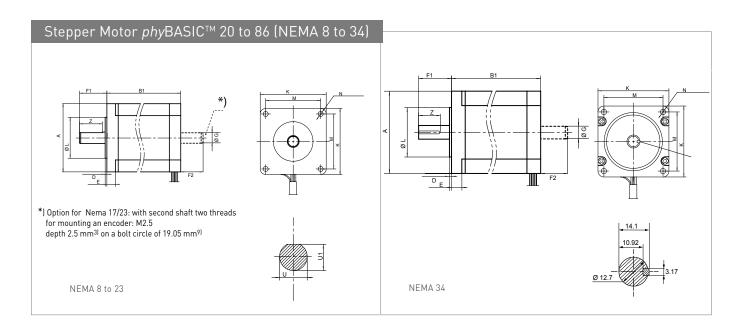

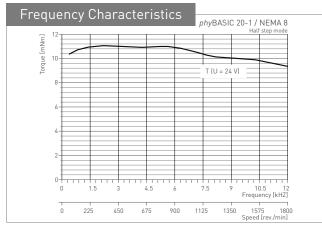

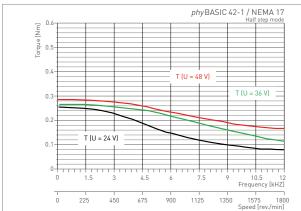

ue smooth running

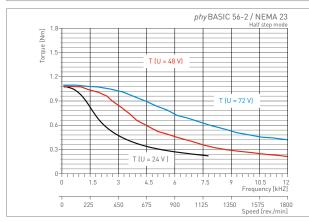

- 2-phase stepper motors
- Holding torques from 16 mNm to 7.2 Nm
- Edge dimension from 20 to 86 mm
- Number of steps (standard) 200
- Step accuracy 5 % for 1.8° stepper motors
- Operating voltage phyBASICTM 20,28,42 (NEMA 8,11,17): 48 V_{DC} phyBASICTM 56,86 (NEMA 23/34): 72 V_{DC}
- Standard connection: 4-lead parallel
- Protection class IP 40
- Insulation class B, 130 °C
- Insulation resistance 100 $M\Omega$
- Operating temperature range -10 to +50 °C (non-freezing)
- Cable with mating connector included
- Options
 - Gear
 - Rear shaft

DMP 20 / 29 / 37

Inertial Damper for Stepper Motors of Size 25 / 32 / 42 (NEMA 11 / 14 / 17)

DMP is an inertial damper for stepper motors. It delivers an excellent performance over a wide frequency because of its specific structure. This minimises settling times in the structure operating region and avoids system resonances

Thus, the DMP prevents not only vibration-induced material fatigue and vibration-induced positioning errors, but also significantly reduces the acoustic noise. If certain perturbances are not adequately compensated for, the motor can lose steps. The resulting loss of torque and precision can drastically affect the application's performance.

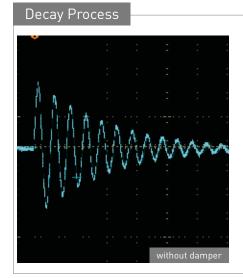

Phytron's stepper motors run very smoothly due to their construction, hence a damper is not needed for most precision applications. However, should a Phytron motor operate in a resonance range, the damper is easily deployed to further enhance the motor's characteristics and stability.

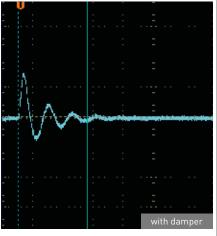

Application

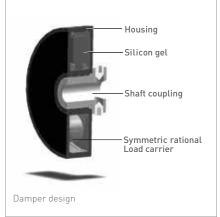

Greater requirements for smooth running and precision are often necessary, especially in optics. When moving samples or optics via a joystick, the improvements in the move quality for smoothness, very low acoustic noise and precision are visibly and audibly attained. Accurate and consistent movements with fast settling times of the driven system are significantly improved.

In Focus

- Inertial damper for stepper motors size 25 / 32 / 42 (NEMA 11 / 14 / 17)
- External diameter 20, 29 or 37 mm
- Mounts onto shafts of 2.5; 3; 4; 5 mm or customised
- Materials
 - Allows fitting to aluminium / plastic
 - Stainless steel fixing screws
- Applicable standards
 - Protection class IP 62 (IEC 34)
 - Headless screws for mounting ISO 4027 (DIN 914/A2)
- Environmental conditions
 - Ambient temperature 0 to +60 $^{\circ}\text{C}$
 - Storage temperature -20 to +70 °C

ZSH Stepper Motor Robust. Powerful. Reliable.

Phytron's HARSH-Environment motors are particularly suitable for challenging applications in mechanical engineering and industry. Challenging conditions are solved with the precise running performance, high torque and the motor's robust design for environments up to IP68. Inside climate chambers, adjusting the paper thickness in paper machines, adjusting rotor blades in aviation or di-

rectly in a fuel tank: In these and other environments Phytron's stepper motors and controllers for HARSH Environments provide precise and reliable work.

In Focus

- 2-phase hybrid stepper motor
- Number of steps: 200 / step angle: 1.8°
- Standard version: 4-lead, parallel windings, with terminal box
- Holding torques from 0.45 to 17 Nm
- Protection class: IP 54, optional IP 68
- Permiss. ambient temperature:
 -30 to +50 °C (optional: +80 °C) (up to 100 °C for short time)
- Design voltage: 250 V_{AC} acc. to EN 60034
- Insulation class F acc. to VDE 0530
- Test voltage: 1800 V_{AC} (1 sec)
- High permissible axial and radial bearing loads
- Step accuracy: ±3 % (ref. to 1.8° step angle, not cumulative)
- Optional:
 - 2nd shaft (IP 41)
 - Free wire ends (IP 41)
 - Different types of flange and shaft (mm or inch)
 - Motor brake
 - Encoder
 - Low-backlash planetary gear

Highlights

The ZSH stepper motor convinces with its robust housing with high-strength cable gland. The motor is waterproof up to $10~\mathrm{m}$ with the IP68 option.

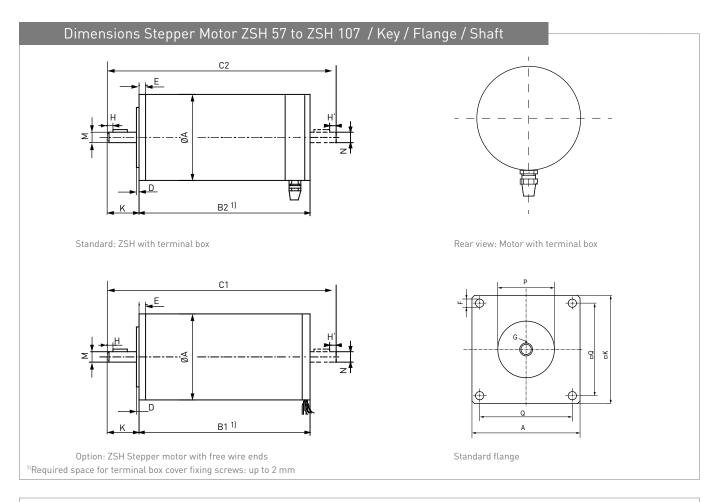

Extended temperature range

The ZSH stepper motor not only convinces with a very balanced, smooth and low resonance running performance with maximum positioning accuracy, but also with the optional extended ambient temperature range of -30 to +80 °C (briefly up to 100 °C).

Overview: Extensions

- $\bullet~$ Stepper motor with brake: Permanent magnet brake for 24 $V_{\mbox{\tiny DC}}$ supply
- Stepper motor with encoder: Resolution 50, 200 or 500 lines, 2- or 3-channels
- Stepper motor with encoder and motor brake
- Stepper motor with low-backlash planetary gear: 1-, 2- or 3-stages, Reduction ratios from 3:1 to 512:1

- ^{1]} Size 88 for bipolar operation only
- ²⁾ Standard version 1/2/3
- ³¹The current value given in the ordering data (e. g. ZSH 107/2.200.8) refers to the bipolar mode (parallel windings). ⁴¹Current in unipolar mode = 0.7 x current in bipolar mode

- $^{\rm SI}$ Resistance per phase in bipolar mode = 0.5 x resistance per winding $^{\rm 4I}$ The inductivity values apply for each single winding as well as for two parallel windings. For series mounted windings, the inductivity is multiplied by 4.

Motor Connection Diagram / Wiring Schemes / Phase Current The Phytron stepper motors type ZSH are built in 4-lead parallel windings (standard). BN BN BK 4 2 3 1 GN/YE PE 4-lead parallel / winding bipolar

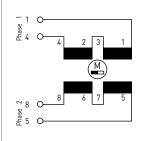

Alternative windings like 8-lead are available on request:

The motors can be used with unipolar or bipolar control mode, as the windings can be differently connected.

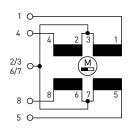

5-lead connection is applicable for the unipolar control mode.

In the bipolar control mode, 4-lead motor wiring is required, windings connected in parallel or in series.

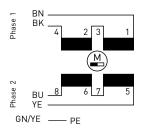

The information in the ZSS motor connection leaflet (delivered with each motor) must be regarded when wiring the motor in order to provide for EMC compliant wiring. The motor connection leaflets are also available for download on the Phytron homepage.

ZSH Stepper Motor with Integrated Encoder

In non disturbed operation the stepper motor runs synchronously to the pulses coming from the controller, that means the motor rotation (= rotation of the rotor) runs synchronously to the pulse frequency (= rotating stator field in the motor). In case of an extreme load at the motor (e.g. via a static load at the motor shaft or by accelerating of the motor) the step frequency of the motor will shortly differ from the pulse frequency within a certain maximum range. This results in changing the load angle (= difference between the real position of the rotor and its target position). For applications homing mode for monitoring the motor movement, we recommend to use a motor with an integrated encoder.

ZSH Stepper Motor with Integrated Encoder E50

The encoder series E50 monitors the motion of the motor. Together with a Phytron controller (e.g. MCC- or phyMOTIONTM series) the load angle of the stepper motor can be controlled and monitored. When the max. admissible load angle is exceeded (e.g. when the motor run is breaking down) the control unit will create an error signal.

Special characteristics

- simple and robust low cost version
- no changes of the motor dimensions in comparison to the standard version with cast connection box (except ZSH 56)
- the encoder is integrated in the motor housing
- available up to protection class IP68
- all requirements for mechanical and climatical ambient conditions (vibration-, shock resistance, temperature and humidity) are fullfilled.
- evaluation of the encoder signals and realisation of a step angle control with generating an error signal can be done by using a Phytron controller of the MCC or phyMOTION™ series.

Electrical characteristics

Supply voltage	5 to 24 V _{DC}
Current consumption	typ. approx. 35 mA (no load at outputs) max. load at outputs 100 mA / output
Operating temperature	-40 to 125 °C

Outputs

2 x 50 pulses per revolution – signals A and B with rectangular shape and inverted signals \overline{A} and \overline{B}

duty cycle 1:1 ± max. 20 % error

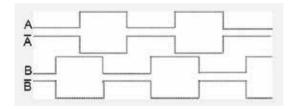

bipolar - switching to VCC and GND

short circuit protected signals against GND

RS422 line driver (26LS31)

pulse frequency min. 20 kHz

Signal outputs

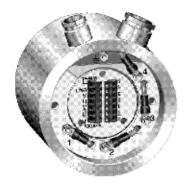

Connection

connection via screw terminals for nominal cross section max. 1mm² (26 -16 AWG)

optionally also available with connector

dimensions as standard motor types! - exception: ZSH 56: see table page $5\,$

ZSH Stepper Motor with Integrated Encoder H200 and H500

The H200 and H500 is characterized by its high resolution; H200 with 2x200 pulse per revolution and the H500 with 2x500 pulse per revolution. As an extremely robust encoder it also fulfills the high requirements for mechanical and climatic environmental conditions (vibration, shock, shock resistance, temperature and humidity).

Special characteristics

- optical encoder
- encoder integrated in the motor housing
- available up to protection class IP68
- all requirements for mechanical and climatical ambient conditions (vibration-, shock resistance, temperature and humidity) fulfilled
- ullet evaluation of the encoder signals and realisation of a step angle control with generation of an error signal can be done by using a Phytron controller of the MCC or phyMOTIONTM series

Technical characteristics

Optical encoder	
Supply voltage	5 V _{DC}
Operating temperature	-40 to 100 °C

Outputs

2 x 200 pulse per revolution for H200

2 x 500 pulse per revolution for H500

rectangular shape signals Aund B, with inverted signals \overline{A} and \overline{B}

H200 and H500: zero pulse and inverted zero pulse - 1 pulse per revolution

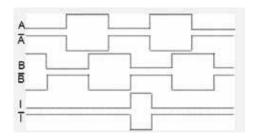

duty cycle 1:1 +max. 10 % error

RS422 line driver (26LS31)

short circuit protected signals against GND

pulse frequency min. 100 kHz

Signal outputs

Dimensions

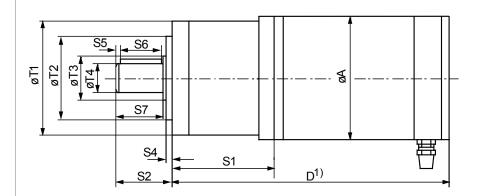

the modified dimensions – compared to the standard motors ZSH without encoder – can be found in the table on page 5.

Connection

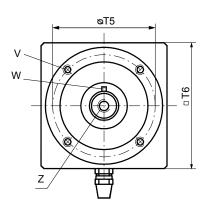

connection via screw terminals for nominal cross section max. 1 mm² [26 - 16 AWG]

optionally also available with connector

Frequency Characteristics

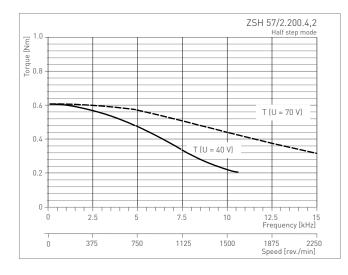

The curves correspond to the limit values of the operational characteristics (T) as a function of the control pulses (frequency/speed), for two different supply voltages (U). The motor connection type is 4-leads with parallel windings. The motors are controlled by Phytron stepper motor power stages in the half-step mode.

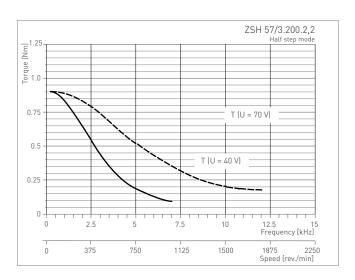

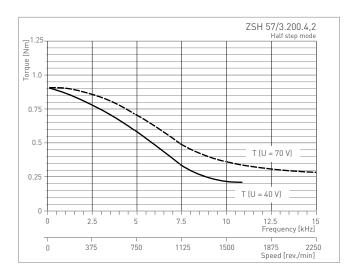

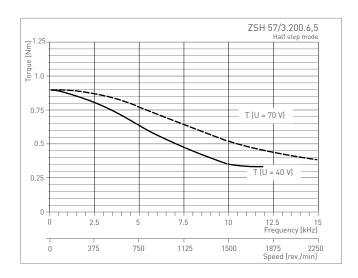

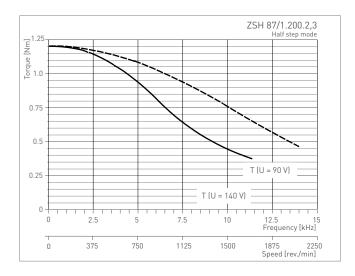

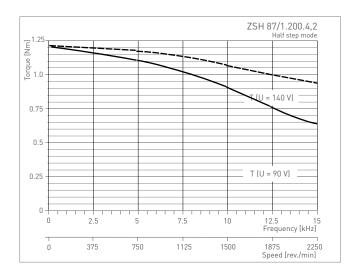

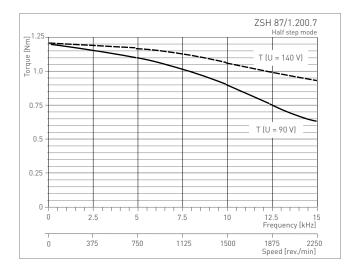

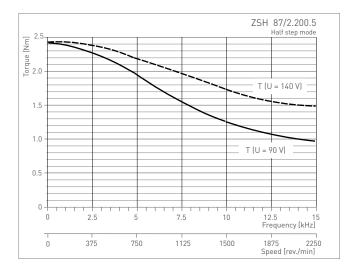

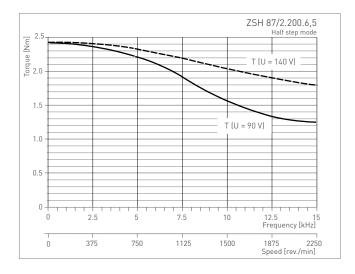

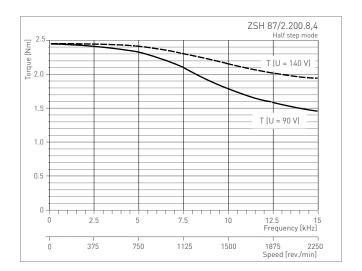

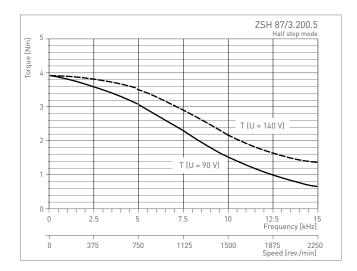

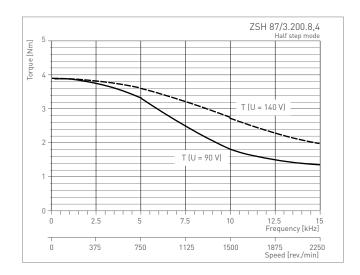

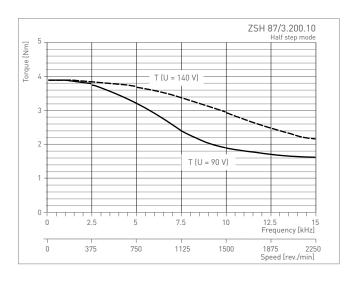

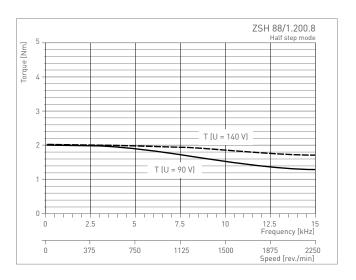

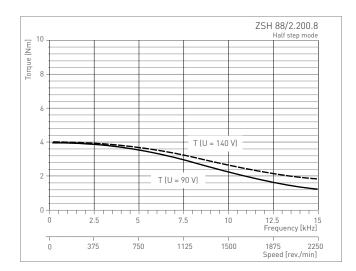

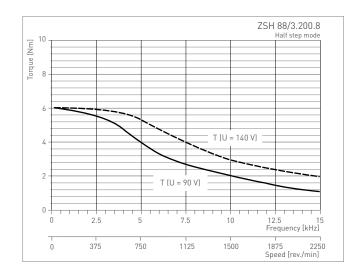

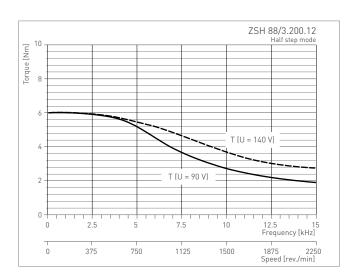

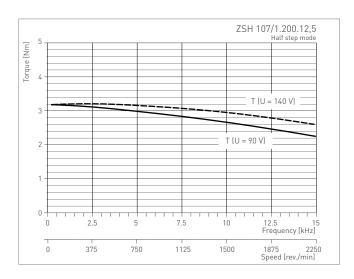

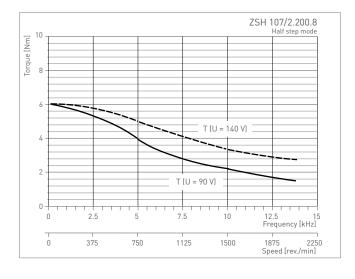

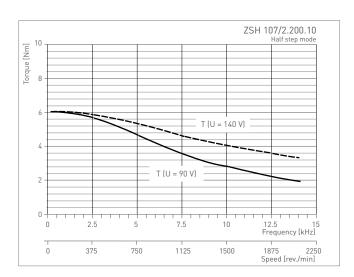

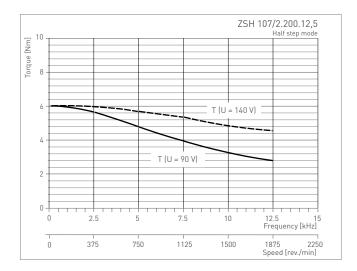

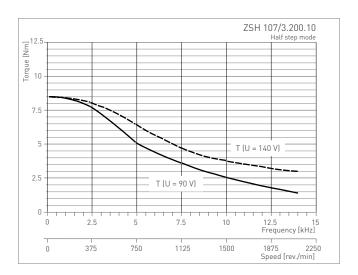

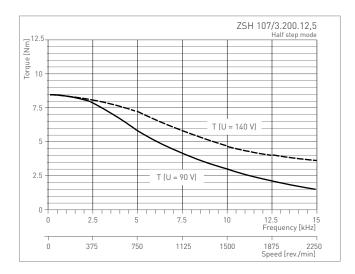

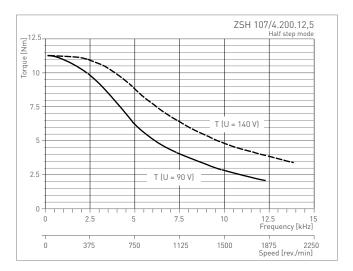

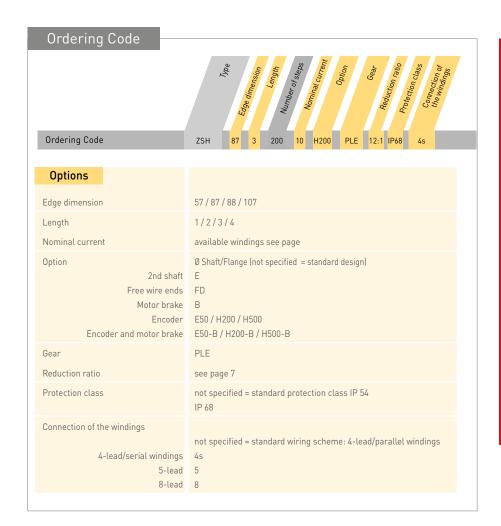

CONFIGURATION AND OTHER DATA

You will find all relevant performance data, dimensions and key figures under the following QR code. In addition to our motors, we offer other components (gearboxes, feedback systems, linear units, etc.) as well as broad customization options (temperature, radiation,

(temperature, radiation, vacuum, design, etc.). We will happily advise you!

EXTREME

VSS / VSH Stepper Motor

For Applications up to Ultra-High-Vacuum

Motors for use in vacuum should not only withstand the vacuum (no bursting of air inclusions), they must not contaminate the vacuum either. By selecting suitable materials and optimised conditioning processes Phytron VSS/VSH stepper motors are ideally suited for use in a vacuum. Through many years of experience with special materials for use in space, we have put a focus on materials with minimal molecular outgassing and high heat resistance. This is the prerequisite for a high vacuum quality and genuine measurement results in scientific and medical applications.

For exact positioning in vacuum, stepper motors are therefore particularly suitable because they can precisely position even without

sensitive feedback providers. Therefore Phytron VSS/VSH stepper motors can be used in particularly challenging environmental conditions (radiation, cryo-temperatures and in a modified design even in space).

Since stepper motors do not generate jitter effects while holding a position, this technology is ideal for precisely aligning optical instruments, mirrors, antennas or samples e.g. in high-resolution microscopes, particle accelerators or molecular analysis devices

The VSS/VSH series is completely manufactured in Germany. You have special requirements? We will gladly develop a customised design for your application.

RoHS

In Focus

- 2-phase stepper motors
- Holding torques from 3.4 mNm to 13 Nm
- Diameters from 19 to 125 mm
- Number of steps 200 (standard)
- Step accuracy 5% for 1.8°
- Operating voltage (power stage)
 Size 19 to 57: 70 V_{DC}
 Size 80 to 126: 120 V_{DC}
- Outgassing holes to avoid pockets of trapped gas

Options

- VGPL precision planetary gear or Harmonic Drive gear
- Thermocouple type KTC/ Pt100 resistor sensor
- Resolver
- Double shaft

Customised solutions

- Operating in an agressive environment
- Clean room applications to clean room class ISO 5 (acc. to ISO 14644-1)
- Motors with spindle

Highlights

Performance & lifetime

Phytron in-Vacuum motors are based on a technology that can also be found in the most challenging projects of our time. From a variety of satellites up to the Mars rover Curiosity: Phytron motors drive applications in distant worlds - highly accurate, reliable and durable. Driven within their specification range, high quality components and a proven design make sure: These motors don't let you down!

Cleanliness

Phytron motors for use in ultra high vacuum (UHV) contain only materials that also meet the requirements of the ECSS (European Space regulations). Thus, each material has a maximum TML (Total Mass Loss) value < 1% and a maximum CVCM (Volatile Mass Losses) value < 0.1 %. You will receive your UHV motor, double-wrapped and vacuum sealed.

Phytron VSS/VSH Stepper Motor

Conditioning

The combination of high quality materials and a special conditioning process allow minimal outgassing rates. So a vacuum of 10^{-11} hPa can be achieved depending on the application. For this purpose, individual components of the UHV motors, such as the wound stator, are specially conditioned before installation, so that outgassing materials cannot be deposited in the ball bearings or inside the motor. The fully assembled motor is outgassed by a Phytron process at least 200 °C in vacuum chambers. Increased outgassing temperatures are available on request. The rule of thumb: the outgassing rate decreases with a decimal power for every 100 °C increase of the outgassing temperature. In the actual application the motor should always be driven at least 40 °C below the outgassing temperature.

Temperature management

All materials selected for the UHV motors can withstand a short-term winding temperature of up to 300° C. Due to the lack of convection in vacuum, the motors can heat up very quickly and often work at a high temperature level - depending on the duty-cycle. In our UHV motors we integrate a thermocouple to allow monitoring of the exact winding temperature. All vacuum motors can be ordered as an alternative to the hermocouple also with platinum probes (PT) or customer- specific sensors. This is how you protect your motors safe from overheating.

Adhesives

The adhesives represent an optimum of strength, ductility, low outgassing rates and thermal resistance. The outgassing rates [TML, CVCM] comply with the European and US-American space standards. While the first adhesive is not brittle even at 4 K, the second adhesive retains sufficient strength even at a winding temperature of 300 °C for short periods without taking damage.

Bearings

The usage of un-lubricated ball bearings can cause so-called cold welding, and thus degrade and completely block the bearing. Therefore, it is advisable to use lubricated ball bearings whenever the application permits. For this purpose a special vacuum grease is necessary to provide not only low outgassing rates but also an extended life-time for the bearing. There is special lubrication for temperatures down to $-50\,^{\circ}\text{C}$ or even $-70\,^{\circ}\text{C}$. However, the viscosity is so high that the efficiency decreases considerably. In low temperatures, the use of dry-lubricated bearings is recommended.

Radiation resistance

With ascending vacuum class motors are equally designed for higher radiation dose to be used in the vicinity of radiation sources (e.g. in medicine and research). While a fine vacuum motor can be safely used only up to a dose of 10 J/kg, a UHV motor may be safely operated up to a dose of 10^6 J/kg . A motor not designed for radiation will not only suffer degradation of the insulation and the adhesives - especially the grease of the ball bearing degrades, reduces the efficiency and ultimately blocks the motor.

Structure design

As is commonly done in high vacuum class all structural elements such as housing, flanges and shafts are made of stainless steel. Outgassing holes in the rear flange also allow rapid evacuation and purging of the motors and make sure that no gas inclusions may occur. All structural elements of the magnetic circuit are basically protected against corrosion. This also allows temporarily handling in normal environment.

Handling

Phytron VSS/VSH motors are primarily designed for use in vacuum. Although the components of the magnetic circuit are basically protected against corrosion, the motors should ideally be handled in clean rooms and clean boxes. A storage is permitted only in Phytron's original packaging. The motors are to be handled with suitable gloves. Since the rotor is magnetic, it must necessarily be handled in a clean environment so that no metal particles may be drawn into the motor. That could lead to an impairment of operation, reduce the life time or even cause the failure of the motor by blocking.

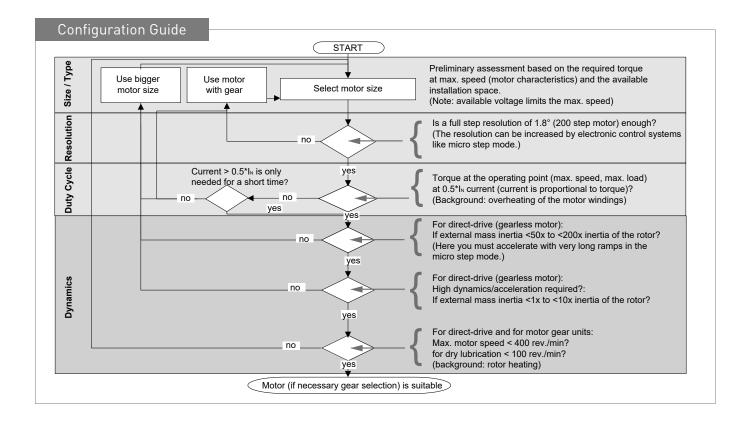

Service, consulting and customising

Of course we are happy if you are satisfied by our standard! But even if our vacuum motor series contains the application experience of several decades - sometimes the standard is just not enough. We like to fit our motor for your application, because sometimes even small changes make all the difference. Special applications require special support: Our service experts are available even after the purchase.

Derating - Duty-Cycle-Design for Applications in Vacuum

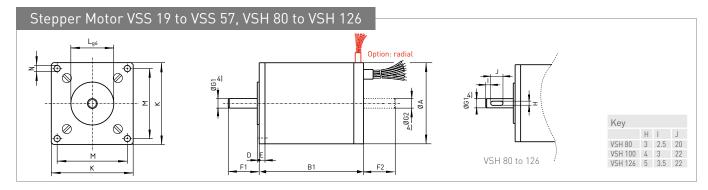

Motors driving in a vacuum heat up very quickly depending on their duty cycle. Driven with nomal current the maximum temperature will be reached within several minutes. Therefore it is necessary to monitor the motor's temperature (K-element) or to design a duty cycle with enough off-time to always keep the motor on a safe temperature level.

The shown curve is set at an environmental temperature of 20 °C. To give you an idea of how the chosen current influences the motor temperature we drew two curves of a VSS 57 motor. Driven with 400 rpm at 0.5 of the nominal current, the motor takes longer to heat up due to less ohmic losses then driven with the full nominal current.

The third curve (VSS 32) with 0.5 nominal current and 200 rmp only leads to a steady state temperature within the safe temperature limits. A higher rotational speed increases the magnetic losses. Therefore high speeds should be avoided as far as possible to reduce heat losses and to protect the bearings.

Winding temperature (in vacuum), environment 20 °C

Stepper Motor with Resolver

In comparison to other resolvers with variable differential rotary transformer, the resolvers R02010 and R03620 use a constant air gap. They are less sensitive to eccentricity and magnetic stray fields and can directly be connected to standard resolver-to-digital-[R/D]-converters.

The resolver is suitable for the use in ultra high vacuum and cryogenic environment – UHVC2 (4K) class available on request.

Resolver - Encoder Converter

Phytron ID: # 10011284

The position data converter controls autonomously the resolver sensor and converts the output signals of the resolver to incremental output signals (square wave signal).

Resolution: 1024 increments

Output reference signal: 8 V_{PP} (diff.)

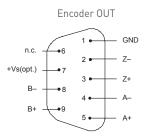

100 mA max.

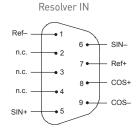

10 kHz

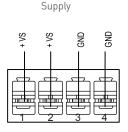

Input SIN/COS: 4 V_{PP} (max.)

Resolver transformation factor: K=0.5

Supply voltage: 24 V (14...36 V_{DC})

Phytron's modular phyMOTIONTM controller evaluates the resolver signals directly with the newly developed resolver evaluation module ECMS01.

Thermocouple Type K and Resistance Temperature Detector Pt100

The insulated temperature sensor in Phytron motors is integrated in the motor windings. The response time to temperature changes of the windung is very short, compared to temperature sensors mounted outside the motor housing. The temperature is measured all the time (even only one motor phase is powered at any time), because the sensors are always mounted between the phases.

Thermocouple element type K

Phytron uses with the Type K (NiCr-Ni) in-vacuum and cryo stepper motors, thermal elements in the temperature range from -270 to +1370 °C, accuracy class 1. The Type K is a metal thermal element with nickel-based alloy conductors. Temperature ranges, accuracy and characteristics of thermal elements for industrial use are defined in the IEC 584 standard (temperature measuring with thermal elements)

The accuracy of the temperature measuring depends on the temperature of the reference point.

Resistance temperature detector (RTD) Pt100

Phytron uses Pt100 resistor sensors in in-vacuum and cryo stepper motors in the temperature range -200 to +300 °C. These precise sensors are used in extreme industrial and laboratory conditions. They consist of a wound resistance wire that is mounted and unsupported inside a cylindrical ceramic case

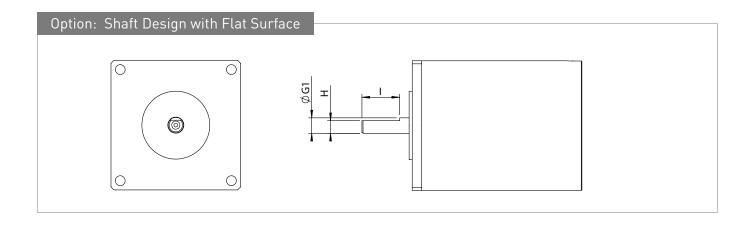

The evaluation of the temperature measuring is possible with the corresponding module in the phyMOTIONTM controller. For the K type variations to some degree are possible.

Efficient Customising - the Perfect Fit

Combine efficiently standard components, modifications & specials

For 30 years we have used our know-how in a lot of successful space projects to optimise our vacuum series for industrial and scientific applications in the matter of performance and cost efficiency. The specific designs of the two-phase hybrid stepper motors have been designed for use in vacuum up to 10^{-11} hPa. Phytron vacuum stepper motors are conditionend at up to $250~{\rm ^{\circ}C}$ for use in the high-(HV) or ulta-high vacuum (UHV) and are designed dependent on the applications for the low-temperature range up to $-196~{\rm ^{\circ}C}$ [N2], $-269~{\rm ^{\circ}C}$ (He), or high-temperature range (winding temperature up to $+300~{\rm ^{\circ}C}$) and, if necessary, also for radiation up to $10^6~{\rm ^{\circ}J/kg}$.

Starting from the VSS/VSH series we have already implemented a number of customer specific projects. Performance, housings, flanges, materials, shaft machining – in the common specification process, the VSS/VSH platform can be optimised for your project. With our high in-house production depth we are not only technologically very flexible, we can also produce small quantities.

Applications

Our vacuum motors, power stages or controllers are driving in a lot of different applications:

- Particle accelerators and X-ray measuring systems (PETRA III, PANTER, FERMI, PAL, SOLEIL,...)
- Devices for molecular analysis
- Electron microscope
- Sputtering systems
- Cryostats
- Mass spectrometry

Stepper motor spindle version for a particle accelerator (Cavity Tuner)

Adjustment of particle accelerator cavities

- stepper motor with 200 steps/revolution (1.8°), with integrated gear 50:1 (10:000 steps/revolution)
- designed for 1300 N axial force
- spindle and nut system, non-magnetic
- material for housing, flanges and internal parts stainless steel or titanium
- dry lubricated for usage under vacuum at -270 °C up to +40 °C (also as grease lubricated version for environments > 35 °C)
- optional EMC cable shielding
- thermocouple K-type in winding

Motion Controller for Vacuum Application: phyMOTION™

Modular stepper motor controller for in-vacuum applications

The phyMOTION™ controller is ideally equipped for the demands of in-vacuum projects. Beside the encoder evaluation (differential incremental encoder with quadrature signals, absolute encoder acc. to SSI standard, BiSS- and EnDat-encoder) a resolver and temperature sensor evaluation of each axis is possible for monitoring of the driven motors. This functions can be integrated as optional submodules of each axis – in addition to the default limit switch evaluations of each axis. The better part of cabling effort is eliminated because the power stages are already integrated.

You can combine with 6 to 21 modules of each housing up to 18 power stages with different functions (axis modules, digital I/O, analogue I/O, 4-axis indexer for interpolation, integrated display)

Via freely selectable HOST interface (ProfiBus, ProfiNet, Ethernet, RS232, RS485, USB, Bluetooth) and provided drivers and protocols (LabVIEW® VI, EPICS) you can seamlessly integrate the phyMOTIONTM also below existing systems.

Operate the $phy {\sf MOTION^{TM}}$ as free programable stand-alone controller, as distributed intelligence, or also as a slave system i.e. below existing PLC systems.

Encoder types suitable for the encoder evaluation:

- Differential incremental encoder with Quadratic signals
- Absolute encoder acc. to SSI standard
- BiSS encoder
- EnDat encoder
- Resolver

Temperature evaluation module for stepper motor temperature monitoring

Thermal elements type K or Pt100 resistor sensors can be used. The insulated temperature sensor in Phytron motors is integrated in the motor windings. The response time is very short. The temperature is measured all the time, even if only one motor phase is powered at any one time.

Control via Android-based integrated touch panel (TPM01) or via Android-based tablets (from version V4.0)

- As user interface i.e. for parameter selection
- For support, parameterisation and diagnostics

LabVIEW®-VI

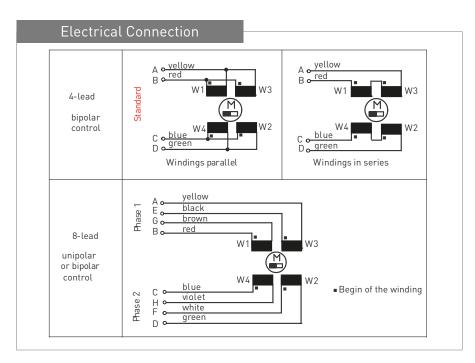

VIs for $phy \mathbf{MOTION}^{\mathsf{TM}}$ – simulation software with graphical style

Use the VIs (Virtual instruments) generated by Phytron and integrate them in your LabVIEW $^{\circ}$ project. So you can easily control the phytron controller phyMOTION $^{\text{TM}}$ from your usual programming environment.

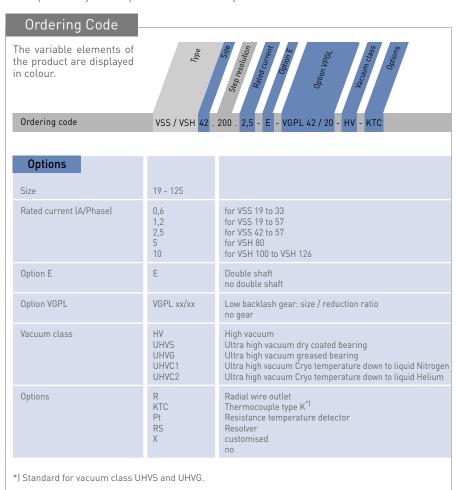

Software environment to develop and realise distributed control systems for large-scale experiments such as telescopes and accelerators. EPICS provides the SCADA support.

Phytron delivers the source code to integrate the Phytron controller phyMOTIONTM into EPICS environment. Also in multi-axis operation: positioning, limit switches, encoder evaluation

All illustrations, descriptions and technical specifications are subject to modifications; no responsibility is accepted for the accuracy of this information.

CONFIGURATION AND OTHER DATA

You will find all relevant performance data, dimensions and key figures under the following QR code. In addition to our motors, we offer other components (gearboxes, feedback systems, linear units, etc.) as well as broad customization options (temperature, radiation,

vacuum, design, etc.). We will happily advise you!

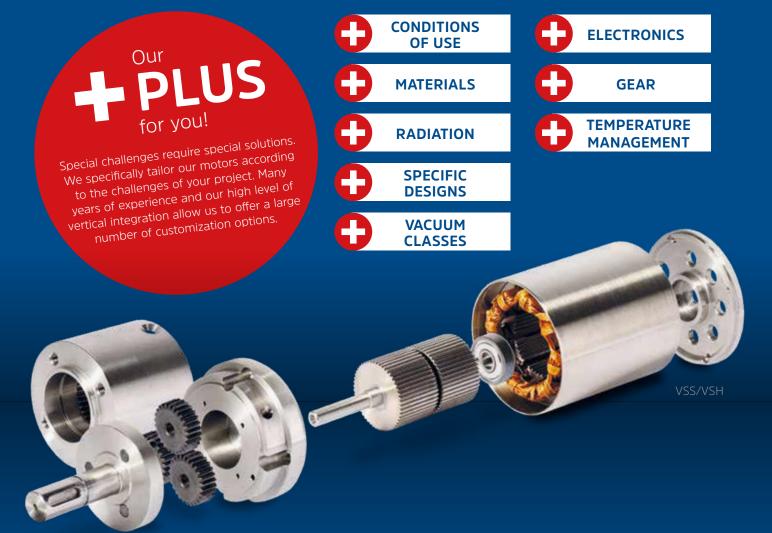

Phytron GmbH Phone +49 8142 503-0 E-Mail info@phytron.de

Admissible phase currents for identical power dissipation Bipolar control mode Full step operation 4-lead motor 4-lead motor 4-lead windings 4-lead current 50% of the rated current

CUSTOMISING

Efficient Customising – combining standard components, modifications and custom-made products efficiently and in a tailor-made manner.

We have already implemented a large number of customerspecific projects based on the VSS/VSH series. Performance features, housing, flanges, materials, shaft machining - in a joint coordination/specification process, the VSS/VSH platform can also be optimally adapted to your project. Thanks to our high level of vertical integration, we aren't just very flexible in terms of technology, we also manufacture small quantities for you - whether it is a customized outer contour, a special degree of protection, increased load capacity or radiation resistance. On the basis of our motor series, we also solve unusual requirements through "Efficient Customising". We fully dedicate ourselves to your project specifications. Specific adjustments to the design and individual components (individual adjustment of the drive shaft, second shaft, etc.), the electronics (winding variants, different operating voltages, etc.) and the material (stainless steel, titanium) can be freely selected. Should your project present even more sophisticated requirements in terms of durability and load limits, we can offer you targeted solutions (e.g. reinforced bearing designs, variation of lubrication coated / grease-lubricated ball bearings). Test us - we are looking forward to your inquiry.

LA Linear Actuator

For Applications in Ultra-High-Vacuum and Cryogenic Environment

Motors for use in vacuum should not only withstand the vacuum (no bursting of air inclusions), they must not contaminate the vacuum either. Through many years of experience with special materials for use in Space, we have put a focus on materials with minimal molecular outgassing and high heat resistance. This is the prerequisite for a high vacuum quality and genuine measurement results in scientific and medical applications.

For exact positioning in vacuum, stepper motors are therefore particularly suitable because they can precisely position even without sensitive feedback providers. Therefore Phytron linear actuators can be used in particularly challenging environmental con-

ditions (radiation, cryo-temperatures).

Since stepper motors do not generate jitter effects while holding a position, this technology is ideal for precisely aligning optical instruments, mirrors, antennas or samples e.g. in high-resolution microscopes, particle accelerators or molecular analysis devices.

Phytron LA linear actuators for cryo (UHVC1;UHVC2) and UHV (UHVS) are completely dry lubricated.

In Focus

- 2-phase stepper motor
- Diameter 25 mm
- Linear speed 1.5 mm/s
- Linear stroke 13 mm
- Screw pitch 1 mm
- Positioning accuracy <0,01 mm
- Operating temperature
 - Cryo version: UHVC1: -196 to -50 °C UHVC2: down to -269 °C (on demand)
 - UHV version (UHVS): -40 to +150 °C
- Rotatory encoder with switching cam
- Linear limit switches for stroke limitation
- Temperature evaluation with K-type
- Mounting position: any
- Lifetime (worst case) 100 000 strokes min.

Options

• VGPL precision planetary gear

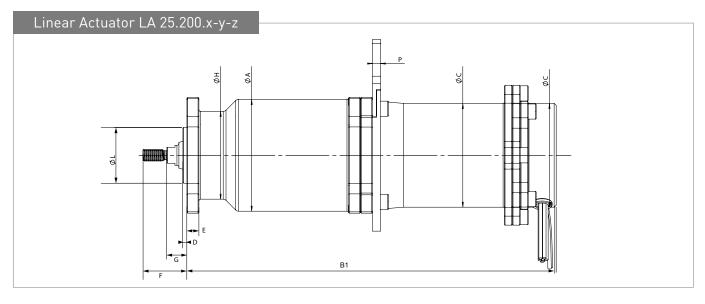

Highlight

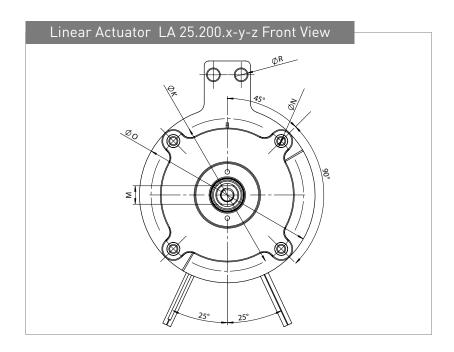

Cleanliness

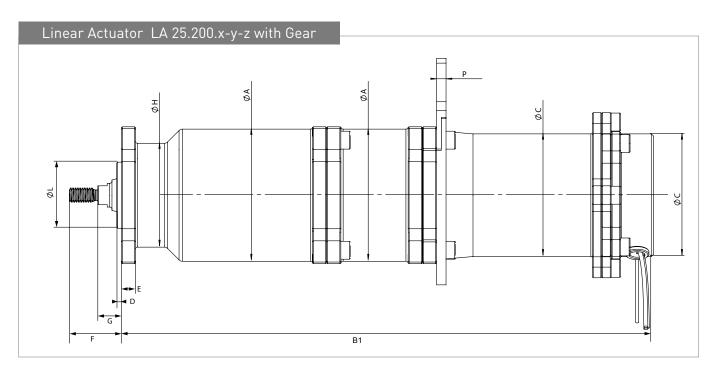

Phytron motors for use in ultra high vacuum (UHV) contain only materials that also meet the requirements of the ECSS (European Space regulations). Thus, each material has a maximum TML (Total Mass Loss) value < 1% and a maximum CVCM (Volatile Mass Losses) value < 0.1 %. You will receive your UHV motor, double-wrapped and vacuum sealed...

phy SPACE™

Stepper Motor Series for SPACE applications, Standard and Customised Solutions

With 30 years of space heritage and over 1000 motors in space we know how to optimise weight, power consumption, thermal dissipation and stray magnetic flux without sacrificing precision or reliability.

phySPACETM represents a standard stepper motor series for SPACE applications. This series comes with features essential to usage in extreme environments. Beyond that it is also the basis for customised projects - to optimise motor-load coupling. Our phySPACETM stepper motors are costefficient, clean and reliable even within extreme environments. The phySPACETM series is developed and built to resist vacuum, vibrations, low/high temperature and radiation while maintaining high performance, precise positioning, long life.

Highlights

Performance & Lifetime

Phytron phySPACETM motors are based on a technology that can also be found in the most challenging projects of our time. From a variety of satellites up to the Mars rover Curiosity: Phytron motors drive applications in distant worlds - highly accurate, reliable and durable. Driven within their specification range, high-quality components and a proven design make sure: These motors won't let you down!

Cleanliness

Phytron motors for use in space contain only materials that also meet the requirements of the ECCS (European Cooperation for Space Standardisation). Thus, each material has a maximum TML (Total Mass Loss) value of 1% and a maximum CVCM (Collected Volatile Condensable Materials) value of 0.1 %. You will receive your space motor, double-wrapped and vacuum-sealed.

In Focus

Standard

- 2-phase stepper motors
- Holding torques from 3.1 to 420 mNm without gearing
- Diameters from 20 to 57 mm
- 200 steps (1.8° per full step)
- Designed for high shock and vibration loads
- 4 leads parallel
- Preconditioned, protection IP 20
- Embedded K-type thermocouple
- Ambient temp. -40 °C... +120 °C
- Up to +200 °C (winding)
- Radiation up to 10⁶ J/kg
- Bake-out temperature up to 200 °C (24 h)
- Outgassing TML <1 %, CVCM <0.1% (at <125 °C)

Options

- "Light weight" upgrade (Titan)
- "Space-testing" upgrade (vibration, shock, thermal cycling)
- Winding cold redundant
- For Cryo applications up to -269 °C

Customised Solutions

- Special designs based on the phySPACE series
- Gear

phySPACE™ Stepper Motor

Structure design

The structure design of the *phy*SPACETM motors presents an optimum of lightweight, stiffness and surface protection. As is commonly done in high-vacuum class all structural elements such as housing, flanges and shafts are made of stainless steel. Even the standard version in stainless steel is optimised in terms of weight: The quadratic flange is reduced to flange lugs and the flanges are hollowed to save additional weight. In order to save even more weight the *phy*SPACETM comes with the option for a "lightweight"-material like titanium.

Bearings

The shock and vibration loads of a rocket launch can stress or damage the ball bearings significantly - resulting in reduced life under certain circumstances - when the motor hasn't even been put into operation. The *phy*SPACETM standard motor is equipped with special ABEC 5 bearings. A duplex bearing assembly in the front flange dissipates the vibration loads safely into the housing structure. Especially when in a vacuum, unlubricated ball bearings can be affected by "cold welding", and thus degrading and even binding the bearings.

Adhesives

The adhesives used are qualified for space applications according to ECSS Q-70-02A. They represent an optimum of strength, ductility, low outgassing rates and thermal resistance. The outgassing rates (TML, CVCM) comply with the European Space Standards and American space standard.

Radiation Resistance

The phySPACETM motors are designed for radiation of up to 10⁶ J/kg for use in space applications. A motor not designed for radiation will not only suffer degradation of the insulation and the adhesives - especially the grease of the ball bearing reducing the efficiency and will eventually cause the motor to fail.

Temperature Management

All materials selected for the phySPACETM motors can withstand a short-term winding temperature of up to 200° C. Due to the lack of convection in a vacuum, the motors can heat up very quickly and often work at a high temperature level - depending on the duty-cycle. In our phySPACETM motors we integrate a thermocouple to allow monitoring of the exact winding temperature. This is how you protect your motors from overheating.

Preconditioning

The selected materials and components are outgassed by a Phytron process at up to $200\,^{\circ}$ C in vacuum chambers, so that outgassing materials cannot deposit in the ball bearings or inside the motor. This way we provide a minimum molecular contamination of the surrounding system so that the motors can even operate close to optical systems.

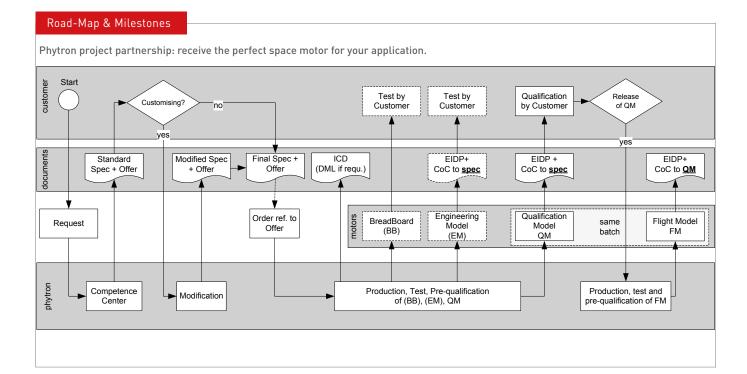

Handling and Storage

phySPACETM motors are primarily designed for use in a vacuum. For this reason the motors must always be handled under controlled conditions: On the ground at 20 °C +/-10 °C and relative humidity <=50%, in clean rooms and clean boxes. Long-term storage is permitted only in unopened original phytron packaging. After storage, or not rotating for more than 6 months, a "running-in" is highly recommended in order to distribute the grease evenly again. The motors are to be handled with suitable gloves. Since the rotor is magnetic, it must be handled in a clean environment so that no metal particles can be pulled through the opening at the at the rear of the motor into the motor. Particles in the motor lead to an impairment of operation, the lifetime, or even failure of the motor due to binding.

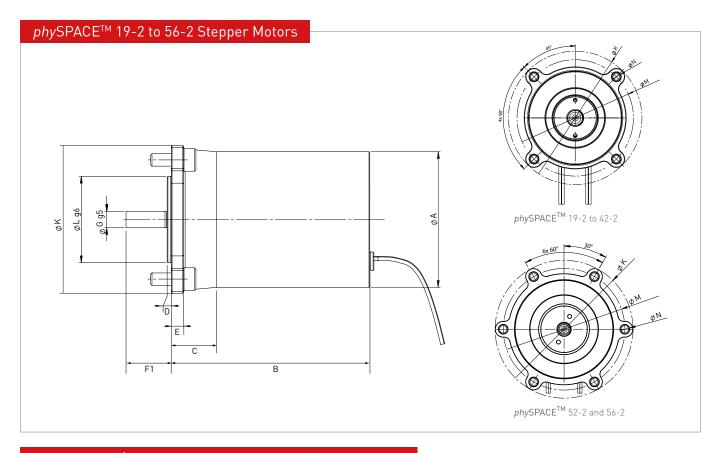

Service, Consulting and Customising

Of course we are happy if our standard already fulfills your application's needs! Although our phySPACETM series integrates our application experience of the last decades - sometimes the standard is just not enough. We offer to create customised solutions to make our motor a perfect fit for your application, because sometimes even small changes make the difference.

Derating - Duty-Cycle-Design for Applications in Vacuum

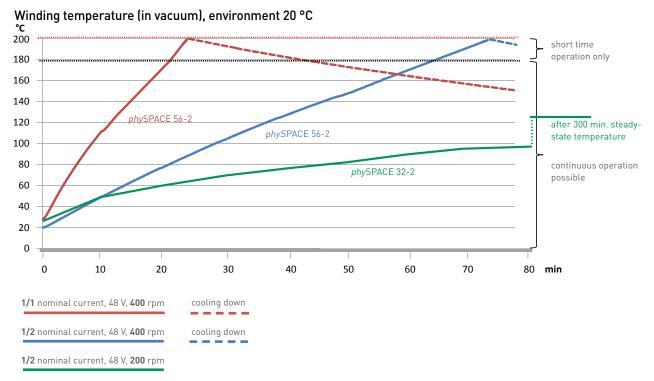

Motors operating in a vacuum heat up very quickly depending on their duty cycle. Driven with nominal current the maximum temperature will be reached within several minutes. Therefore it is necessary to monitor the motor's temperature (K-element) or to design a duty cycle with enough off-time to always keep the motor a safe temperature level.

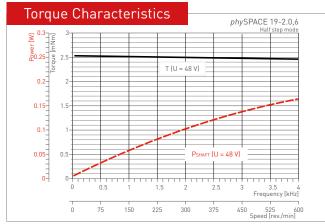

The shown curve is set at an environmental temperature of 20 °C. To give you an idea of how the chosen current influences the motor temperature we drew two curves of a motor similar to the phySPACETM 56. Driven with 400 rpm at 50 % of the nominal current, the motor takes longer to heat up due to less ohmic losses then driven with the full nominal current.

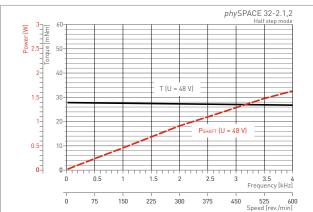

The third curve (phySPACETM 32-2) with 0.5 nominal current and 200 rmp only leads to a steady state temperature within the safe temperature limits.

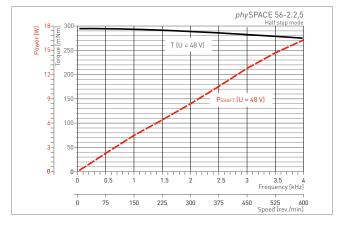

A higher rotational speed increases the magnetic losses. Therefore high speeds should be avoided as far as possible to reduce heat losses and to protect the bearings.

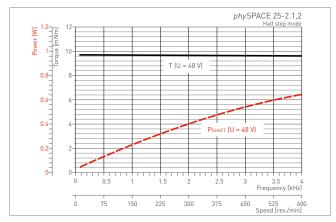

The cooling down speed during the off-time depends on the temperature delta in between the current motor temperature and the environmental temperature and the connected structure's thermal capacity.

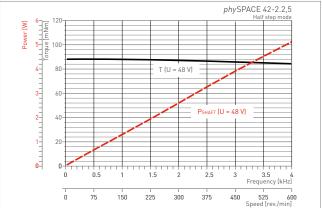

Motor Temperature Sensors: K-type Thermocouple

The insulated temperature sensor in Phytron motors is integrated in the motor windings. The response time to temperature changes of the windung is very short, compared to temperature sensors mounted outside the motor housing. The temperature is measured all the time (even if only one motor phase is powered at a time), because the sensor is always mounted between the phases.

Efficient Customising - the Perfect Fit

We proudly contribute to projects of:

Tailored Stepper Motors for Space Applications

BepiColombo - MERTIS (due to launch in 2015)

MErcury Radiometer and Thermal Infrared Spectrometer

- Instrument: http://www.dlr.de/os/desktopdefault.aspx/ tabid-6956/
- Mission: http://www.esa.int/Our_Activities/Space_Science/BepiColombo_overview2
- For: Polish Academy of Science (PAS), DLR, ESA

oi Colombo image: NA

MAVEN (2013)

Launch date: Nov. 18, 2013; mission target: mars - explore its upper atmosphere; orbit insertion date: Sept. 22, 2014

- Grating flip mechanism, 90° deflecting angle moving in hard end stops
- Cleanliness for optics
- Motor: size 25, hybrid stepper 200 steps/rev
- Gear: integrated planetary gear ratio 50:1, 90 deg travel
- Structural parts titanium, hybrid bearings, lubrication
- Titanium coupling: compensation of an axial length reduction during deformation without additional stress
- For LASP / NASA

LASP MAVEN image: NASA/Goddard Space Flight Center

Tailored Stepper Motors for Space Applications

Mars rover CURIOSITY for NASA (2011)

Phytron stepper motor focuses laser and the analysis camera $% \left(1\right) =\left(1\right) \left(1\right)$

- Focuses the laser light and the analysis camera inside the ChemCam instrument on the sample.
- Excels in reliability, durability, vacuum compatibility and minimal outgassing rates.
- Optimised for mechanical friendly smooth running and is capable of precise positioning even without feedback or complex electronics

Mars rover CURIOSITY - ChemCam image: NASA

JUNO (2011)

Mirror rotation in Ultraviolet Imaging Spectrograph

- Phytron's stepper motor: VSS 32
- Instrument: http://adsabs.harvard.edu/ abs/2008AGUFMSM41B1678G
- Mission: http://www.nasa.gov/mission_pages/juno/main/index.html
- NASA / ESA

Juno image by NASA/JPL

MIRIS (2010)

Multi-purpose infrared imaging system (MIRIS)

- Instrument: http://www.isas.jaxa.jp/home/rikou/kogata_eisei/symposium/2nd/koto/07.pdf
- For: Astronomy and Space Technology R&D Division, Korea Astronomy and Space Science Institute

Tailored Stepper Motors for Space Applications

EnMAP mission

Shutter calibration mechanism as part of the scientific payload of the German EnMAP mission.

- Customised titanium gear shaft for low weight and strength
- Tailored magnet arrangement to minimise stray magnetic flux
- Redundant windings cater for loss of primary coils
- Harmonic Drive gears for space conditions
- Duplex bearings to better absorb shock and vibration
- Central housing configuration for optimised force transmission (hybrid assembly technology)
- For: Kayser-Threde and HTS

A perfect fit for EADS Astrium.

High precision positional actuator for the X-Band Downlink Antenna for the KOMPSAT S/C:

- Customised titanium main structure for low weight and optimal strength
- Integrated Harmonic Drive gear unit
- Duplex bearings to withstand shock and vibration
- Special lubrication system to prolong lifetime
- Customised leadwire exit to meet project constraints
- Motor model endurance tested in vacuum and N2 atmosphere (bearings, lubrication system, gears)

SOLACES (2003)

- Stepper motor with 200 steps/revolution (1,8°)
- Designed for 300 N axial force
- Holding torque 70 mNm / driving torque 60 mNm
- Spindle system, non-magnetic
- Special grease; designed for ultra high vacuum at -50 °C to +40 °C
- For: IPM Freiburg

Tailored Stepper Motors for Space Applications

Rosetta - Cosima (2004)

Cometary Secondary Ion Mass Analyser

- Motor: stepper motor VSS19
- Instrument: http://www.mps.mpg.de/de/projekte/rosetta/cosima/#instrument
- Mission: http://www.esa.int/Our_Activities/Space_Science/Rosetta
- For: Max-Max-Planck-Institut, Extraterrestrische Physik München

STEREO (2006)

The sun in 3D

- Mission: http://www.nasa.gov/mission_pages/stereo/main/index.html
- For: NASA + The Johns Hopkins University

XMM-Newton - EPIC (2000)

European Photon Imaging Camera (EPIC)

- Instrument: http://sci.esa.int/xmm-newton/31281-instruments/?fbodylongid=774
- Mission: http://xmm.esac.esa.int/
- For: Max-Max-Planck-Institut, Extraterrestrische Physik München, ESA

Cassini-Huygens (1997)

Exploring Saturn

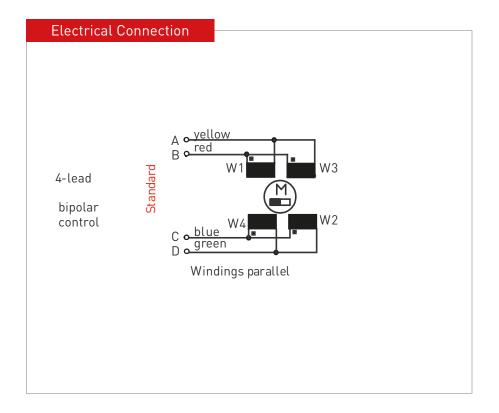

- Mission: ESA: http://www.esa.int/Our Activities/Space Science/Cassini-Huygens
- Mission: NASA: http://www.nasa.gov/mission_pages/cassini/main/
- For: Max-Planck-Institut, Heidelberg, ESA, NASA

MOS-IRS-P2 (1996)

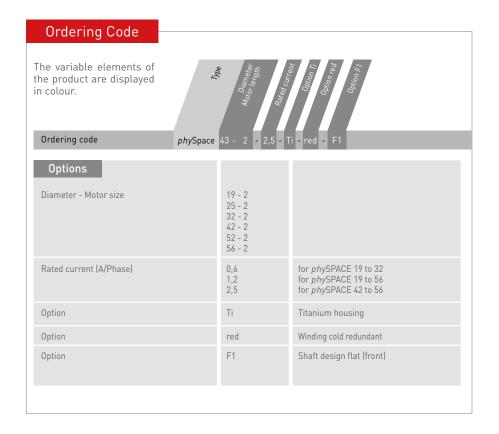

Indian Remote Sensing Satellite-P2

- Mission: https://earth.esa.int/web/guest/missions/3rd-party-missions/historical-missions/irs-p3
- For: DLR
