About ebm-papst.

ebm-papst is a leader in ventilation and drive engineering technology and a much sought-after engineering partner in many industries. With around 20,000 different products, we have the perfect solution for practically every requirement. We believe the consistent further development of our highly-efficient GreenTech EC technology provides our customers with the best opportunities for the future in industrial digitization. With GreenIntelligence, ebm-papst already offers intelligent networked complete solutions that are unique anywhere in the world today.

Six reasons that make us the ideal partner:

Our systems expertise: as experts in advanced motor technology, electronics and aerodynamics, we provide system solutions from a single source.

Our spirit of invention: our 600 engineers and technicians will develop a solution that precisely fits your needs.

Our lead in technology: with our EC technology and GreenIntelligence, we combine the highest energy efficiency with the advantages of IoT and digital networking.

Closeness to our customers: at 49 sales offices worldwide.

Our standard of quality: our quality management is uncompromising, at every step in every process.

Our sustainable approach: we assume responsibility with our energy-saving products, environmentally-friendly processes, and social commitment.

GreenIntelligence. *Making Engineers Happy.*

Why do our customers look so happy? Because when it comes to the Internet of Things and the digital transformation, we provide them with a clear competitive edge with GreenIntelligence for intelligent control and interconnection of fans, drives and systems to make applications more powerful, processes more efficient, businesses more successful and their customers more satisfied.

For the wide range of automation tasks needed in **industrial drive technology**, what you need most is an experienced partner who understands your needs. The drive experts at ebm-papst have detailed applications expertise and, thanks to GreenIntelligence, can offer drive solutions with intelligent networking capabilities that cater for all requirements perfectly.

Here is how much GreenIntelligence there is in ECI Motors:

- integrated logic & power electronics
- network functionality
- Master/slave functionality
- Condition monitoring
- Predictive maintenance

Anna exploits the possibilities of the Industrial Internet of Things throughout her logistics and production processes.

The story of our success

to market and technology pioneer.

- 1963** Founding of **Elektrobau Mulfingen GmbH & Co. KG** by Gerhard Sturm and Heinz Ziehl.
- 1965** First tubeaxial fan developed in EC-/DC technology.
- 1966** ebm's success takes off with the new 68 motor.
- 1972** The first ebm foreign subsidiary is established in Sweden.
- 1988** Gerhard Sturm is awarded the Federal Cross of Merit.
- 1990** The sixty millionth external rotor fan was produced .
- 1992** Acquisition of **PAPST Motoren GmbH** in St. Georgen.
- 1997** Buyout of the **Landshut** (mvl) plant.
- 2003** Change of name to **ebm-papst**.
- 2007** Introduction of the gearhead "**EtaCrown®**".
- 2010** **GreenTech** – our sign for energy efficiency and resource preservation.
- 2012** Introduction of a new generation control electronics (**K4**) for BLDC motors.
- 2013** ebm-papst acquires the gear specialist, **Zeitlauf**, and wins the **German Sustainability Award**.
- 2014** Launch of the BLDC internal rotor motor, **ECI 80**.
- 2015** Introduction of the overload-capable planetary gear "**Optimax 63**".
- 2016** Expansion of the electronic production plant, St. Georgen **Hagenmoos**.
- 2017** Introduction of **intelligent compact drives** with bus interface K5
- 2018** **GreenIntellegence** – our symbol for high efficient and network capable EC motors.

Information for ECI motors

Key figures

- 3-phase, electronically commutated internal rotor motor with high-performance magnet
- Power range between 30 and 750 watts
- High power density realized in a compact design
- High overload capacity
- Long service life
- Very quiet operation
- Detection of rotor position via Hall sensors
- Customer-specific winding layouts
- Winding insulation as per insulation class E
- Protection class IP 54 as per EN 60 034-5: up to IP 65

- Various motor types which can be combined with planetary and crown gearheads
- Optional integrated control electronics
- Optional encoder and brake modules

Approvals

- Support with the accreditation of products in different economic areas and markets
- As an experienced and competent partner we would be happy to support you
- Possible approvals include CE, UL, CSA, EAC
- Additional approvals on request

RoHS

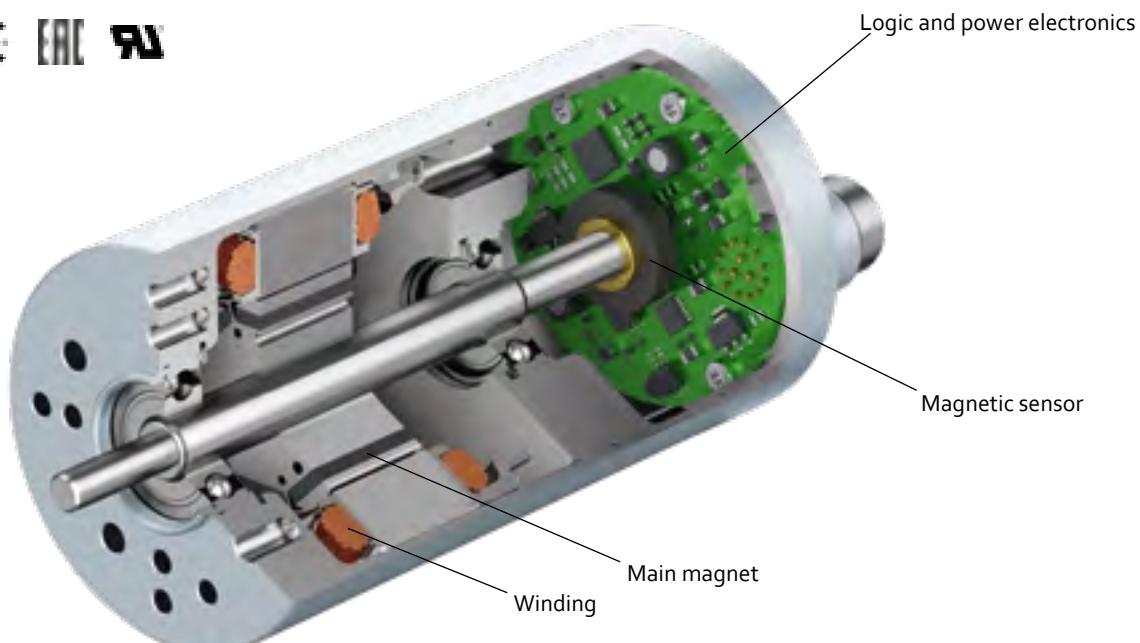

European Directive EC No. 2011/65/EU (RoHS)

Of course, all current products have been designed for conformity with European Directive 2011/65/EU (RoHS). All older products that do not yet conform to these directives or parts thereof will be consistently redesigned. Thus we can confirm that basically, all of our products listed in this catalog conform to the above-mentioned directive.

REACH Directive (EC Nr. 1907/2006)

The units you purchase from us are products as defined by REACH and thus do not require registration. However, in our own interest and to ensure a high degree of product safety, we track the implementation of REACH and the resulting requirements as part of our duty to provide information.

To comply with the requirements of REACH, we are in contact with all suppliers from whom we obtain chemicals (substances), preparations and components that we use as part of our production process. Within this framework, ebm-papst fulfills the obligations set forth in the REACH regulation. Also to possible questions to these two topics, we are always at your disposal.

The data in this catalog contain product specifications, but are not a guarantee of particular properties.

All information is based on the measuring conditions mentioned below. Operation of motors using reference electronics at an ambient temperature of max. 40°C when attached (thermally conductive) to a free-standing metal plate of the following size:

For motor ECI 42: 126 x 126 x 10 mm.

For motor ECI 63: 189 x 189 x 10 mm.

For motor ECI 80: 240 x 240 x 10 mm.

It should be noted that a brake integrated in the motor or a gearbox mounted on the motor will change the specification values

The **nominal operating point** is the basis for the electro-magnetic design of the motor from the point of view of the maximum possible continuous output of the motor and is specified by the nominal values described here.

The values mentioned are typical values for the design in question and are also subject to the tolerances included in the specifications or drawings. Unless otherwise stated, the supplements and safety notes contained in the relevant operating and assembly instructions must be kept at all times. Subject to availability and technical alterations.

Nominal output power P_N [W]

The output power which the motor can produce continuously; it is calculated from nominal torque and nominal speed. For the electro-magnetic design of the motor the determination of the nominal operating point is based on the fact that the nominal output power is close the maximum output power of the motor.

Nominal voltage U_{BN} , U_N , U_B [V DC]

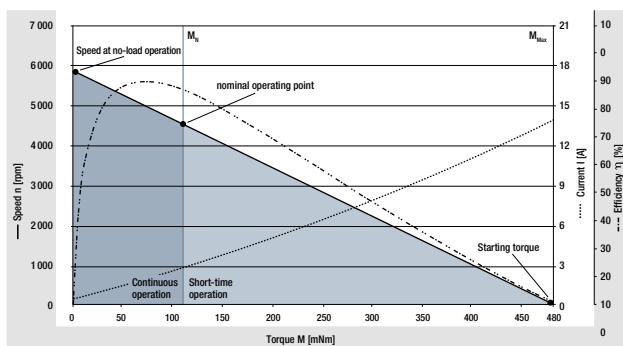

The DC voltage (i.e. DC voltage range) that is applied to the commutation electronics as a system supply voltage. All nominal values listed in the technical tables of the individual motors refer to this voltage. Motor applications are, however, not restricted to this voltage.

Nominal speed n_N [rpm]

The speed at which the motor may be operated continuously while delivering nominal torque at an ambient temperature of 40°C and nominal output torque. It is an operating point on the max. motor curve based on an ideal electronics with negligible losses.

Nominal torque M_N [mNm]

The torque that the motor can deliver continuously at an ambient temperature of 40°C and nominal speed.

The illustrated curves are idealized representations based on the figures in the tables.

Nominal current I_{BN}

The current that is drawn from the system supply when the motor delivers nominal torque at nominal speed.

Speed at no-load operation n_{BL} [rpm]

The speed that takes effect at the nominal voltage and with unloaded motor. The theoretical possible speed at no-load operation can, in some cases, be limited by the mechanical ceiling speed.

No-load current I_{BL} [A]

Is established with nominal voltage and unloaded motor; is largely influenced by the bearing friction. For drive systems that have a separate supply for power and logic, the no-load current is called I_L . This no-load current is the sum of the power supply (I_{ZK}) and the low-power logic supply (I_B).

Definitions for ECI Servomotors

Permanent stall torque M_{Bn0} [mNm]

Is the maximum permissible torque with which the motor may be permanently loaded when the rotor is locked.

Permissible eff. continuous stall current I_{noeff} [A]

Is the maximum permissible current which at a stalled motor is allowed to flow into the motor lead as an effective value.

Continuous stall power P_{Bn0} [W]

Is an approximate value for the voltage-independent maximum permitted output ($P=U \times I$) that can be taken from the DC voltage source in holding status.

Permissible peak torque short-term M_{max} [mNm]

Is the torque which the motor can usually deliver for a short time. (M_A)

Permissible peak current, motor lead I_{max} [A]

Is the current that must flow in to the motor lead as a peak value to achieve the short-time peak torque.

Induced voltage U_{imax} [V/1 000 rpm]

Maximum value of the induced voltage between two motor leads at 1 000 rpm. It is a dimension for the electromagnetic utilization of the motor.

Connection resistance R_v [Ohm]

The winding resistance that is measured at 20°C between any two of three winding terminations.

Connection inductance L_v [mH]

The average inductance that is measured at 20°C between any two of three winding terminations using a sinusoidal wave measuring frequency of 1 kHz.

Rotor moment of inertia J_R [kgm²×10⁻⁶]

The mass moment of inertia of the rotor and necessary dimension for the dynamic characteristics of the motor.

Protection class

Information on the protection class; it describes protection against foreign particles (Point 1) and water (Point 2).

Permissible ambient temperature range T_u [°C]

Defines the minimum and maximum permissible ambient temperature to which the mentioned performance values apply when the motor is in operation. The permissible winding temperature in the motor (115°C for insulation Class E, as per EN 60 034-1) </1125 should not be exceeded.

Weight m [kg]

Weight of the delivered unit without additional units or packaging.

Max. shaft load Fradial/Faxial [N]

The permissible forces are divided into radial and axial load values. They are based on the maximum permissible values for the motor bearing during operation at normal rating and a defined service life expectancy L_{10} .

Service life L_{10}

The values for the L_{10} service life specified in conjunction with the permitted bearing loads have been calculated to DIN ISO 281. In addition to the specified values, this calculation is based on operation of the motor at nominal conditions (nominal torque, nominal speed) and an ambient temperature of max. 40°C. Therefore, the service life information is explicitly not a guarantee of service life, but strictly a theoretical quality figure.

Max. reverse voltage [V DC]

When the braking function is activated and when the set value step change is negative, the motor operates in controlled braking mode. In this operating state, the large part of the braking energy is fed back to the intermediate circuit until the max. reverse voltage is reached and the electronics prevent a further increase beyond this value by chopped braking. This behavior should be given special consideration when selecting the system supply.

Set value input

Speed setting via an analogue interface for DC voltage. Depending on the drive design, the set speed can be configured in a range from 0 ... n_{max} , where the minimum possible speed value (with limited control quality) is about 0 rpm (sine commutation) or approx. 50 to 100 rpm (block commutation). (Relevant only for drives with integrated operating electronics).

Recommended speed range [rpm]

Speed control range within which the speed control accuracy stipulated in the system specification is complied with.

Starting torque [mNm]

Is the torque that can be delivered over a short time when the motor is started based on the electromagnetic motor characteristics and the set current limitation.

Effective torque M_{eff} [mNm]

For cycle operation (e.g. "S5" operating mode – intermittent duty with the effect of the startup losses and the losses due to electrical braking on the heating), the effective torque corresponding to continuous operation ("S1" operating mode) is determined according to the following formula:

$$M_{eff} = \sqrt{\frac{M_{A^2} \cdot t_A + M_{L^2} \cdot t_B + M_{Br^2} \cdot t_{Br}}{t_A + t_B + t_{Br} + t_{St}}}$$

M_A	Starting torque	M_{Br}	Braking
t_A	Acceleration time	t_{Br}	Braking time
M_L	Load torque	t_{St}	Standstill time
t_B	Load period		

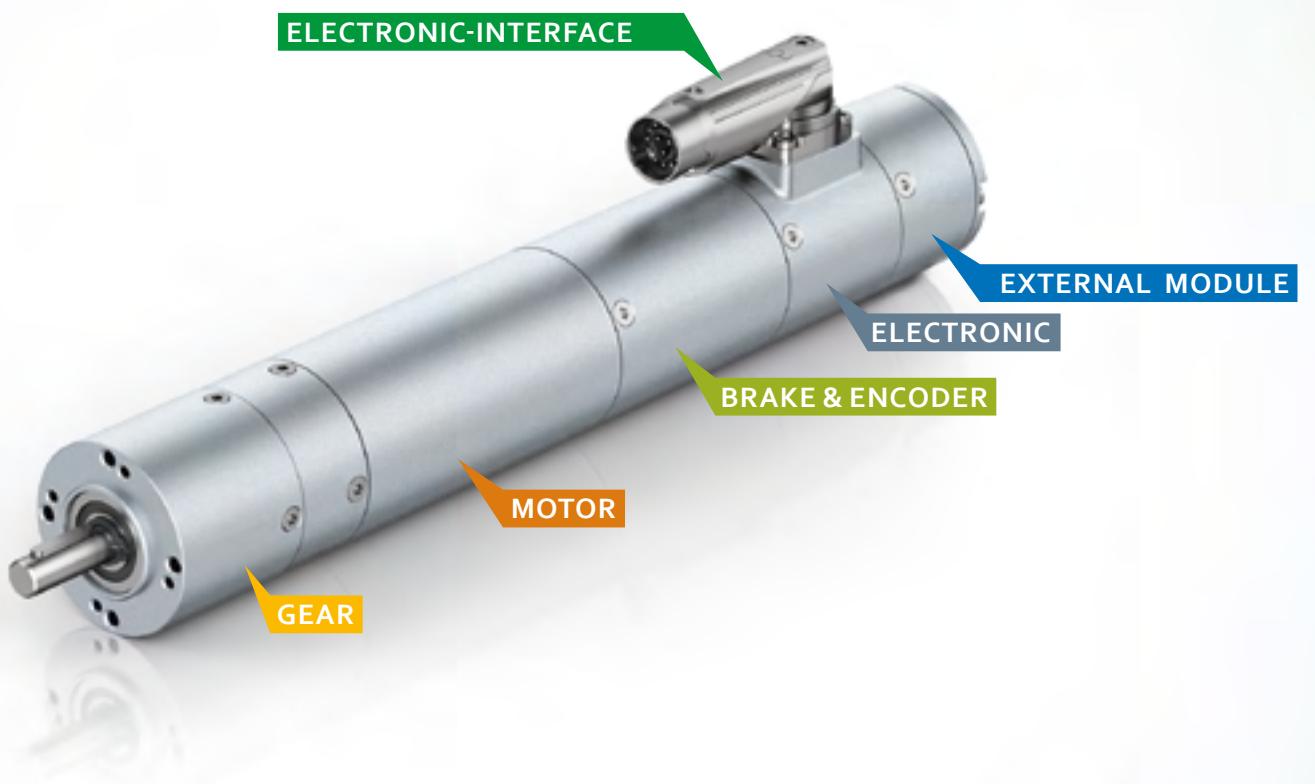

At an ambient temperature of 40°C this effective torque must not be greater than the nominal torque M_N listed in the catalog for the selected motor. For intermittent operation (operating mode S3 with t_r = relative on period) the following permissible load moment applies:

$$M_L = M_N \cdot \sqrt{\frac{100}{t_r}}$$

System selection

When selecting a motor and operating for a drive system, consideration should be given to the fact that the values permitted for the motor should not be exceeded by the electronics. Likewise, the relationship shown in the commutation sequences between the sequence of Hall signals and the corresponding switching times and switching states of the output stage at the phase supply lines must be observed in order to attain optimum operation of the motor.

Please contact the manufacturer if the products are operated or stored under non standard environmental conditions.

With our **preferred type** products, we offer a selection of motors and gear motors which are available and ready to ship within 48 hours. Preferred type products can be ordered with a maximum order quantity of 20 products per order. With standard type products, we refer to a wide range of motors and gear motors which can be ordered using the stated order numbers with standard delivery times.

Further products for your project requirements are available **on request**. These products are generally available but cannot be ordered by means of an allocated material number. We reserve the right to make changes to the necessary order numbers after technical and economic evaluation of the requirement.

Description

- Motor with completely integrated K3 operation and control electronics
- Low cogging torque
- Integrated speed control
- Interface with analog and digital control inputs
- Output stage enabled via digital hardware enabling
- Field-oriented closed-loop control
- 15-pole plug

Description

- Motor with integrated 4Q controller
- Speed, torque or position mode possible
- Selection of operating modes and parameter setting via RS485
- Extensive interface with various inputs and outputs
- Integrated brake chopper
- Speed set values from n=0 with holding torque up to 5 000 rpm
- Excellent control behavior via field-oriented control with sine commutation
- High efficiency and high power density realized in a compact design
- User-friendly parameter setting with „driveSTUDIO“ PC software

Servomotor ECI-80.XX-K1

More at

www.ebmpapst.com/eci-motoren

Description

- Highly dynamic 3-phase internal rotor motor with EC technology
- Low cogging torque
- Robust, noise-optimized ball bearing system for a long service life
- High efficiency and high power density realized in a compact design
- Basic motor with electronic module K1 for operation with external control electronics
- Mechanical design and interfaces designed for modular flexibility

Type	ECI-80.20-K1 -B00	ECI-80.20-K1 -D00	ECI-80.40-K1 -B00	ECI-80.40-K1 -D00	ECI-80.60-K1 -D00
Characteristic curve	A	B	C		
Nominal voltage (U_N)	V DC	24	48	24	48
Nominal speed (n_N ²⁾	rpm			4 000	
Nominal torque (M_N ²⁾	mNm	700	700	1 200	1 200

Information for gearheads

In the gearbox product range, we offer three types of transmission technologies. These include planetary gearing, crown gearhead units and spur gears, all individually adapted to the requirements of the customer according to the modular principle. Deciding which of these technologies will render the best results for the respective application, ultimately depends on the application itself.

Planetary gearhead

- Higher reduction ratios within first and second stage
- Very quiet operation
- Extremely high performance
- Compact design
- No offset axle
- Comprehensive range of products with three model types
 - Noiseless Plus â€“ unique quiet operation
 - Performax® â€“ extreme performance
 - Optimax â€“ robust and long lifetime

Crown gearheads

- Outstanding efficiency
- Large reduction ratio range
- No self-locking
- Highest power density
- No offset axle
- Two different model ranges
 - EtaCrown®
 - EtaCrown® Plus

The comprehensive range of **planetary gearbox** products is used when high power densities are required.

When it comes to achieving high efficiency with minimal noise, the **NoiselessPlus** is the impressive, obvious choice. Its exemplary smooth operation is achieved thanks to extremely sturdy, helical planetary wheels made of high-strength plastic.

Performax®Plus delivers smooth operation and high performance. Helical planetary wheels made of high-strength plastic ensure excellent smooth operation in the first stage. The combination with a hardened ring gear in the output stage means that high outputs can be achieved.

Optimax offers maximum robustness at the highest power density. Straight-toothed planetary wheels made of high-strength steel in the first and second gear stage allow high peak loads and also ensure that the transmission has a long life. If there are increased noise requirements, high-strength plastic planetary wheels can be implemented in the input stage as an option.

ebm-papst impresses with innovative **crown gearhead** technology in its family of crown gearheads.

The **EtaCrown®** is a convincing offering with its wide reduction range and compact design. Space can always be saved during installation thanks to zero axle misalignment with a symmetrical structure. High radial loads can also be incorporated via a double ball bearing on the output shaft.

The **EtaCrown®Plus** requires minimum assembly space while achieving maximum power. Thanks to a downstream planetary stage, it can achieve significantly higher torques compared to the EtaCrown of the same size.

The output shafts of the ebm-papst transmission are generally made of hardened and ground case-hardened steel, meaning that they are particularly durable. Torque is transmitted via a keyway connection as standard.

Planetary gearhead NoiselessPlus 42

Planetary gearhead Performax® Plus 42

Image of 2-stage gearhead

More at

www.ebmpapst.com/eci-motoren

Description

- High torques thanks to large gearing width in the first gear stage
- Good shock resistance due to housing made of case-hardened steel with linear tooth profile in the output stage
- Very quiet operation due to helical teeth in the first gear stage
- Planetary wheels made of plastic with optimized sliding properties in the first stage ensure smooth operation
- Large effective diameter thanks to radial screw connection

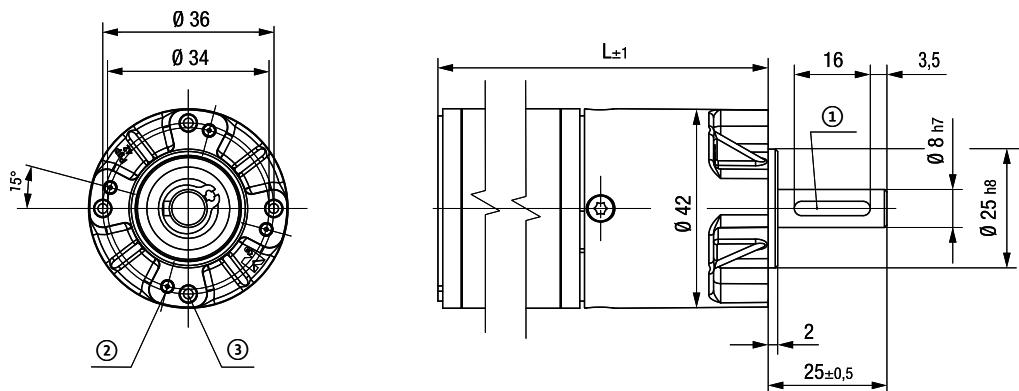

Type		Performax®Plus 42.1		Performax®Plus 42.2

Planetary gearhead Optimax 42

Description

- Extreme high overload capability to cope with peak torques
- Robust gearhead concept for extended service life
- Modular design and interfaces for maximum flexibility within ebm-papst modular system
- High efficiency in compact design
- Noise optimized version with planetary wheels made from high-strength plastic

Crown gearhead EtaCrown® 52

Image of 2-stage gearhead

More at

www.ebmpapst.com/eci-motoren

Description

- Maximum safety in design and operation, as well as optimal vandalism protection; no automatic lock due to high efficiency of the crown wheel technology
- Space-saving installation due to zero offset axle and symmetrical structure
- Flexible application possibilities with various optional shaft outlets and available shaft geometries
- Wide reduction range by means of upstream / downstream planetary stage
- High radial loads due to double ball bearing in the output shaft

Crown gearhead EtaCrown® Plus 42

Image of 3-stage gearhead

More at

www.ebmpapst.com/eci-motoren

Description

- Compact design due to combination of the crown wheel and planetary stage in one housing
- No automatic lock due to high efficiency of the crown wheel technology
- High torques by using 5 straight toothed planetary gears made of case-hardened sintered steel in the integrated planetary gear stage
- Wide reduction range thanks to possibility of an upstream planetary stage
- Improved quiet operation thanks to the optimized design of the crown wheel stage when using an upstream helical planetary gear stage made of plastic with optimized sliding properties

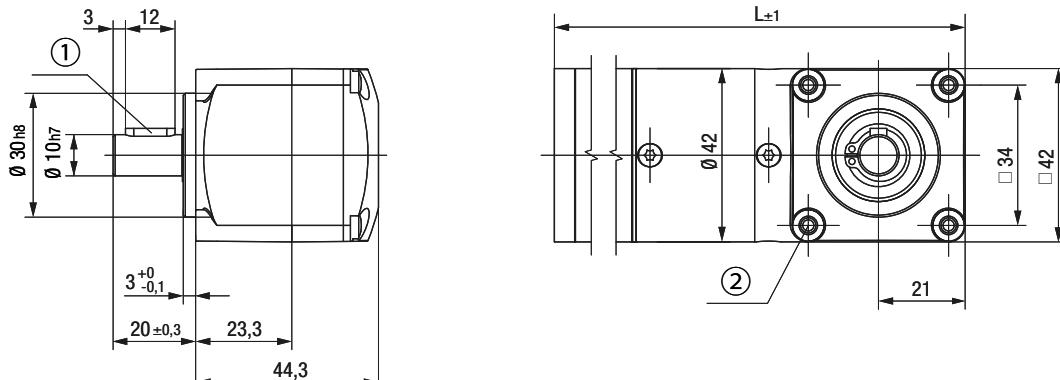

Type	EtaCrown®Plus 42.3				
Reduction ratio	54.0	84.8	153	289	
No. of stages		3			
Efficiency		0.73

Parameterization and commissioning

The RS485 interface serves as an interface for parameterization and diagnosis. It can be operated using the freely available "driveSTUDIO" PC software. This requires a PC and the ebm-papst USB-RS485 adapter. Load your detailed operating manual and the PC software "driveSTUDIO" under www.ebmpapst.com.

Brakes

Image integrated Brake

Description

- Spring-applied brake
- Single-disk brake with 2 friction contact surfaces
- Braking torque effective in powerless state
- Braking force is eliminated by electromagnetic force
- Holding brake with emergency stop function
- Currentless-operated brake with high power density
- Reduced inertia for optimum dynamics

Magnetic encoder systems

Image integrated Encoder

Description

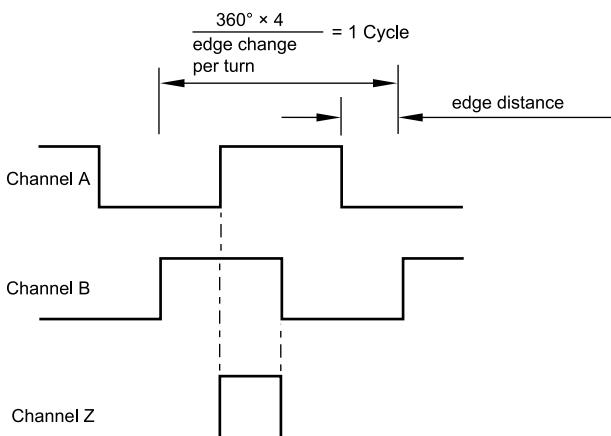

- Magnetic 3 channel incremental encoder
- A resolution of max. 4.096 increments per revolution is attained by appropriate evaluation in an external control
- The encoder is contactless and wearfree
- Temperature range -40 °C ... +105 °C
- Additional resolutions and interfaces possible

Operating factor, lifetime, efficiency

Operating factor c_B

To achieve a uniform lifetime for the gearheads and motors, the necessary torques M must be increased by the respective operating factor c_B under the various operating loads so as not to exceed the maximum permissible gearhead torque $M_{2\max}$ (see table below).

Operating modes

	Load			Operating period in h/days					
	even	gradual	sudden	3 h up to 10 switching ops./h	8 h	24 h	3 h over 10 switching ops./h	8 h	24 h
One rotation direction	•			1.00	1.00	1.20	1.00	1.20	1.52
Rotation direction change	•			1.00	1.30	1.59	1.20	1.59	1.92
One rotation direction		•		1.11	1.30	1.59	1.30	1.52	1.82
Rotation direction change		•		1.41	1.72	2.00	1.59	1.89	2.33
One rotation direction			•	1.20	1.52	1.82	1.52	1.82	2.22
Rotation direction change			•	1.59	2.00	2.33	2.00	2.33	2.86

Operating mode

It is necessary to define the operating mode under which a gear motor can be operated with certain nominal values in order to avoid over-loading the motor and/or the gearhead. The values stated in this cata-log refer to S1 operation (continuous operation). This means that the gear motor can be constantly operated with the stated values, but can also have a higher load placed on it for a short time. Please contact us if you require more information about this.

Lifetime

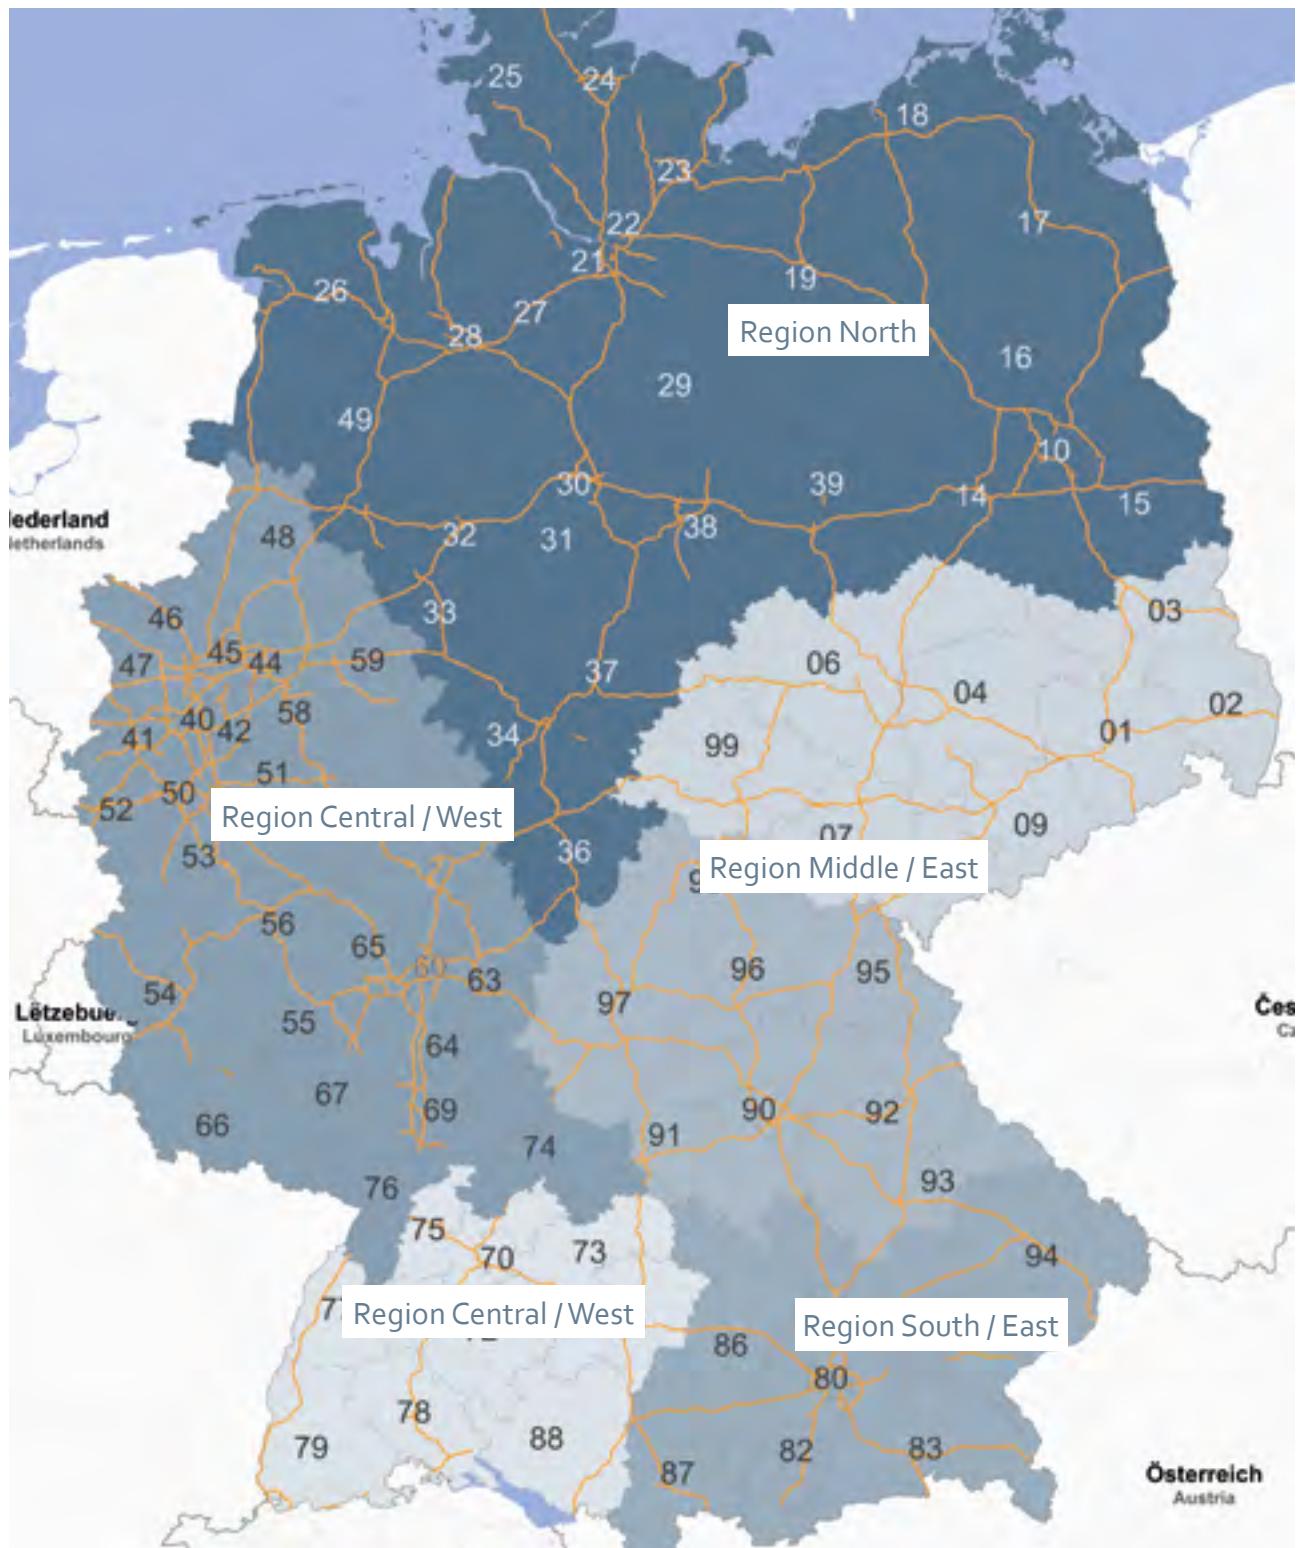

Lifetime is limited by the various components in the drive. If frequently overloaded, the gearhead components are subjected to more wear than under nominal load. Extreme ambient and operating conditions cause a reduction in the lifetime guaranteed for operation under operating ratio $c_B = 1$.

Efficiency η (eta)

The efficiency per gear stage is at least 90%. Depending on the tooth configuration and on the manufacturing quality, far better levels of efficiency can also be achieved. The following overall efficiencies were obtained for multi-stage gearheads:

Overall efficiency	
for 1-stage gearhead	$\eta = 0.9$
for 2-stage gearhead	$\eta = 0.9^2 = 0.81$
for 3-stage gearhead	$\eta = 0.9^3 = 0.73$
for 4-stage gearhead	$\eta = 0.9^4 = 0.66$
for 5-stage gearhead	$\eta = 0.9^5 = 0.59$
